

# AN10862

## LPC1000 software development toolchain

Rev. 04 — 21 May 2010

Application note

### Document information

Info	Content
<b>Keywords</b>	LPC1000, GNU-GCC
<b>Abstract</b>	How to use the GNU toolchain with the Cortex LPC1000 series

### Revision history

Rev	Date	Description
04	20100501	Include Linker flag --gc-sections
03	20100125	Include "SWD" in debug config and IAR test examples
02	20091214	Include Keil test examples
01	20090827	Initial version

## Contact information

For additional information, please visit: <http://www.nxp.com>

For sales office addresses, please send an email to: [salesaddresses@nxp.com](mailto:salesaddresses@nxp.com)

## 1. Introduction

LPC1000 is the new chip series that is based on the ARM Cortex processor family with many advanced features.

This document will show how to use the toolchain in LPC1000 series such as: LPC17xx (Cortex-M3), LPC13xx (Cortex-M3) and LPC11xx (Cortex-M0) families.

In this document, we will illustrate the setup of microcontroller LPC1768 on Keil MCB1700 evaluation board, using the GNU Toolchain. All examples code are also compiled and tested in Keil and IAR development platform.

## 2. Software update requirement

Here is a list of setup files should be installed:

- Java Runtime Environment (required by IDE – Eclipse)
- CodeSourcery Toolchain
- C/C++ Eclipse IDE
- Zylin CDT plugin for Eclipse.
- Segger J-link GDB server and driver.
- Flash Magic.

### 2.1 Java Runtime Environment

First, we must check for Java Runtime Environment on system since Eclipse IDE is written partially in JAVA.

- Go to the command prompt, type command “Java –version” and look at the result.

The screenshot shows a Windows XP command prompt window titled 'cmd.exe'. The window title bar says 'C:\WINDOWS\system32\cmd.exe'. The window content shows the following text:  
Microsoft Windows XP [Version 5.1.2600]  
(C) Copyright 1985-2001 Microsoft Corp.  
  
C:\Documents and Settings\nxpmig>java -version  
java version "1.6.0\_05"  
Java(TM) SE Runtime Environment (build 1.6.0\_05-b13)  
Java HotSpot(TM) Client VM (build 10.0-b19, mixed mode)  
  
C:\Documents and Settings\nxpmig>

Fig 1. JAVA version check

- If windows cannot recognize this command or the version is not equal to or higher than 1.6.0\_01, you will need to download and install JRE in the next step.

#### Downloading Java Runtime Environment

- Go to the website: <http://www.nxp.com/redirect/java.sun.com>
- Look for “Download” item, follow these links and find the setup file “Java Run Time Environment” (JRE) as shown in Fig 2.

**Java Runtime Environment (JRE) 6 Update 6**[» Download](#)

The Java SE Runtime Environment (JRE) allows end-users to run Java applications.

[Installation Instructions](#) | [ReadMe](#) | [ReleaseNotes](#) | [Sun License](#) | [Third Party Licenses](#)**Fig 2. Download JAVA Runtime Environment**

The version found on the website may be latest, and hence different from the example given in this application note.

## 2.2 CodeSourcery toolchain

Go to <http://www.nxp.com/redirect/codesourcery.com/release830> and download the latest package release for Windows platform, and then install this package in your system after removing the previous version of CodeSourcery Lite.

Please note that the GNU version in “makeconfig” file must be changed to correspond to this release version.

**Packages**

Download	MDS Checksum
<b>Recommended Packages</b>	
IA32 GNU/Linux Installer	474331dcf4140c8211f70d1ab169957b
IA32 Windows Installer	55bc4ea8beca7cd20da629cb804f6334
<b>Advanced Packages</b>	
IA32 GNU/Linux TAR	940024f157f6775bc2a02ef12cd67801
IA32 Windows TAR	8d47fdfe36de50ba8c3380754ca7ddc3
Source TAR	58be5107bd73f87f2d86ff5a7af0def9

**WHAT'S IN THIS RELEASE?**

The datasheet provides information about key components of Sourcery G++ Lite 2009q1-161.

**Fig 3. Update CodeSourcery toolchain**

## 2.3 Eclipse IDE for C/C++

Go to this website to download the Integrated Development Environment – IDE of Eclipse:

<http://www.nxp.com/redirect/eclipse.org/downloads>**Eclipse IDE for C/C++ Developers (68 MB)**An IDE for C/C++ developers with Mylyn integration. [More...](#)

Downloads: 326,029

**Fig 4. Choose “Eclipse IDE for C/C++ Developers” item to download**

Install Eclipse IDE after downloading and set all options to default during installation.

## 2.4 Zylin CDT plug-in

Go through Help → Software update...

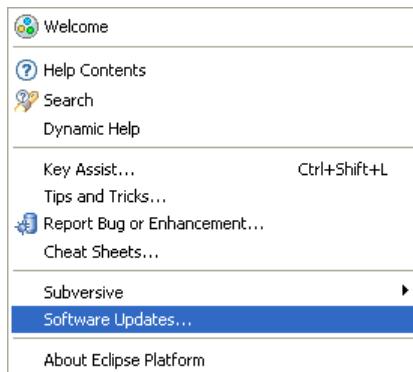

Fig 5. Choose Software Update in Eclipse

If the site <http://download.eclipse.org/tools/cdt/releases/ganymede> exists in Available Software, choose all items inside there, and then click Install... Follow remaining steps to complete the update.

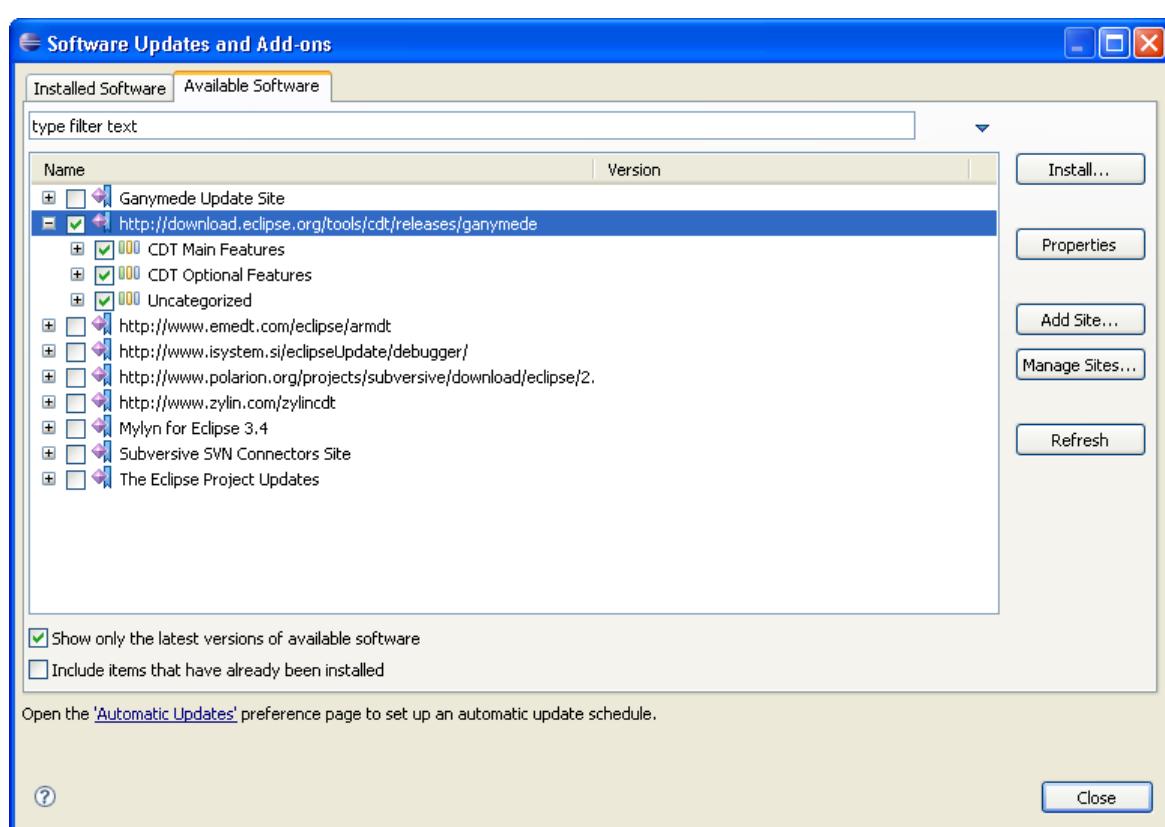

Fig 6. Check all items inside <http://download.eclipse.org/tools/cdt/releases/ganymede> sub-item

If this site address does not exist, click Add Site and fill this address in to dialog  
<http://www.nxp.com/redirect/download.eclipse.org/ganymede>

For the Zylin Embedded CDT plug-in, because its repository has been removed and changed to <http://opensource.zylin.com/zylincdt>, we need to re-target this link in Eclipse software update.

Click the Add Site button as shown in Fig 6, fill in the location field with the new site address, and follow the remaining steps to complete the update.

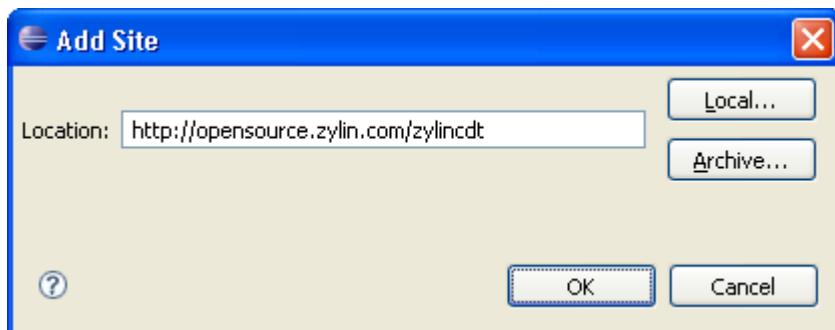

Fig 7. Update Zylincdt with new repository

## 2.5 Segger J-link

Go through [http://www.nxp.com/redirect/segger.com/download\\_jlink.html](http://www.nxp.com/redirect/segger.com/download_jlink.html) to download the latest J-Link software.

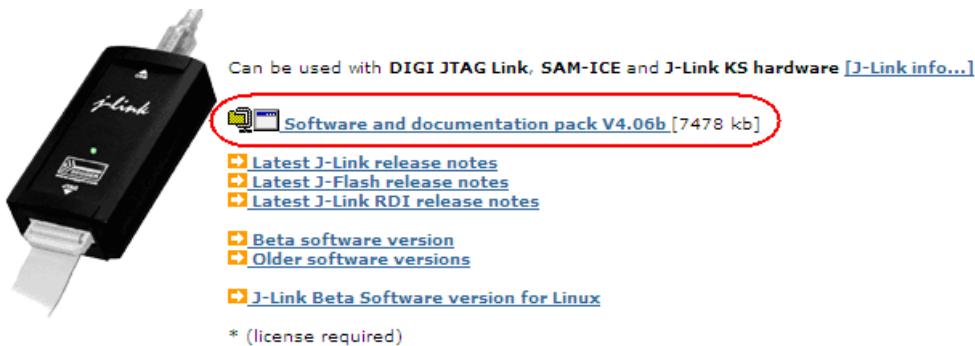

Fig 8. Update J-link software from SEGGER

## 2.6 Flash Magic

Flash Magic has supported flash downloading for LPC17xx series.

<http://www.nxp.com/redirect/flashmagictool.com/>

### 3. Running Eclipse for the first time

#### 3.1 Eclipse workspace setup

- Initialize Eclipse on the desktop:

Fig 9. Initialize eclipse icon on the desktop

- Set workplace for the first time here. In this case, a new workspace named “nxpdrv” (also the name of the new folder) will be created in the root of the C: drive; all the projects will be located in “C:\nxpdrv\”.

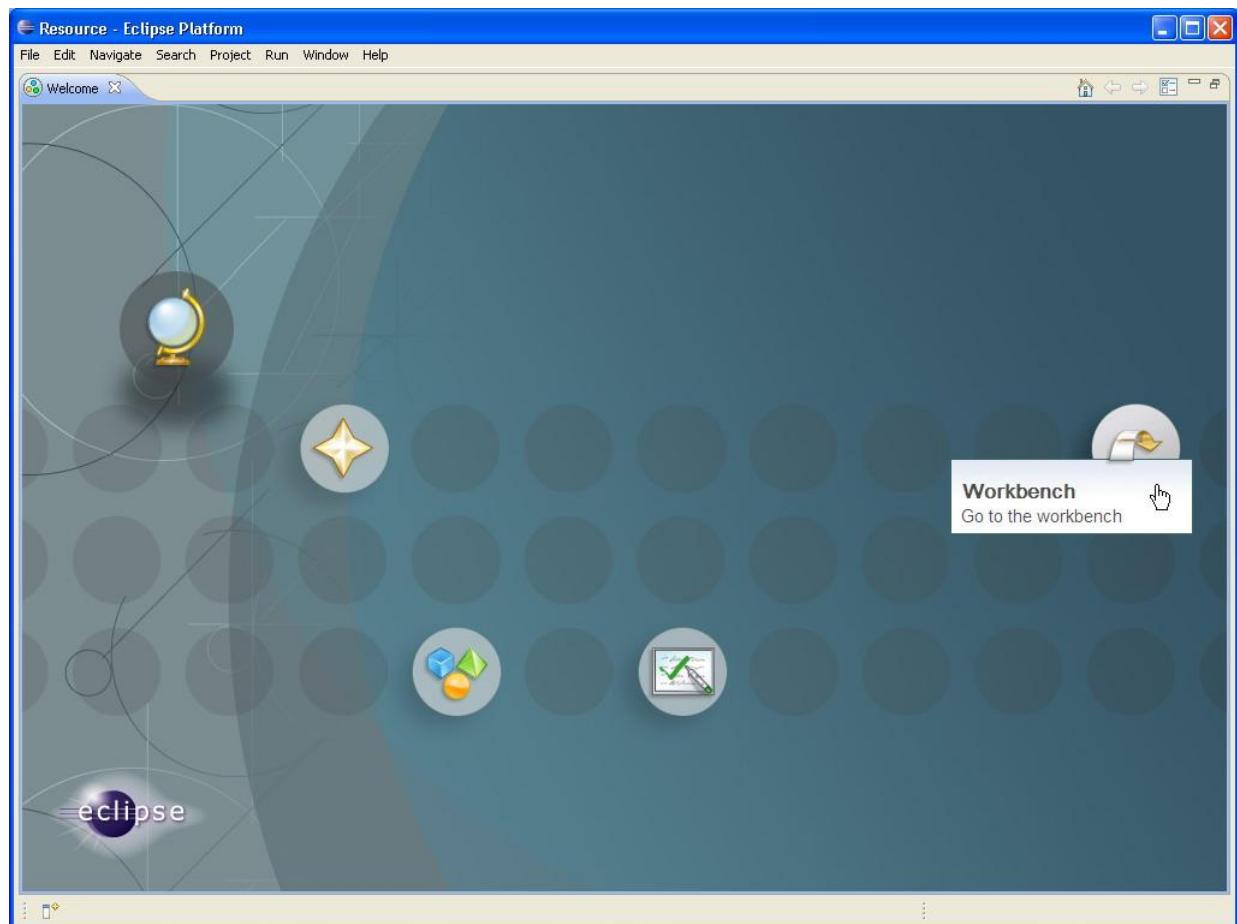

Fig 10. Set workplace and Eclipse for the first time

- Open perspective: Window → Open Perspective → Other ...

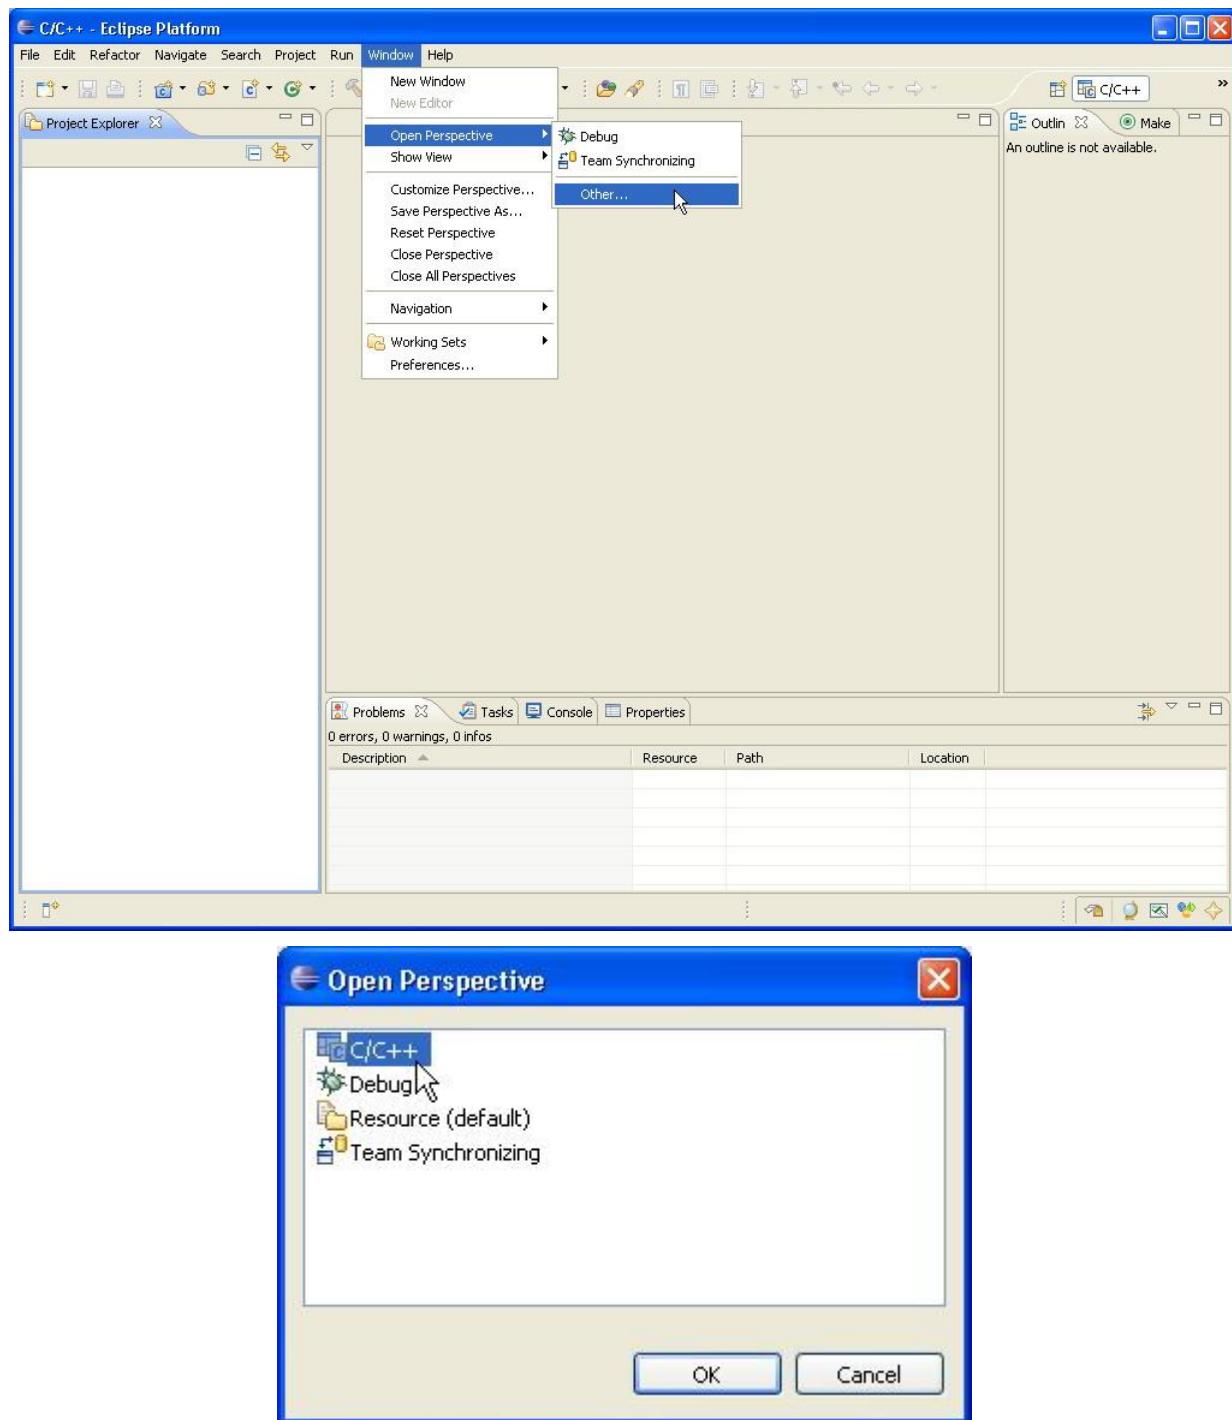

Fig 11. Open perspective for C/C++

### 3.2 Setting up External tools for Eclipse

The Workbench provides the mechanism for running tools that are not part of it.

The examples shows how the following tools are added:

- Flash magic.

- GDB Server
- Serial terminal (existing on Windows)

### Flash magic tool

Run → External Tools → Open External Tools Dialog...

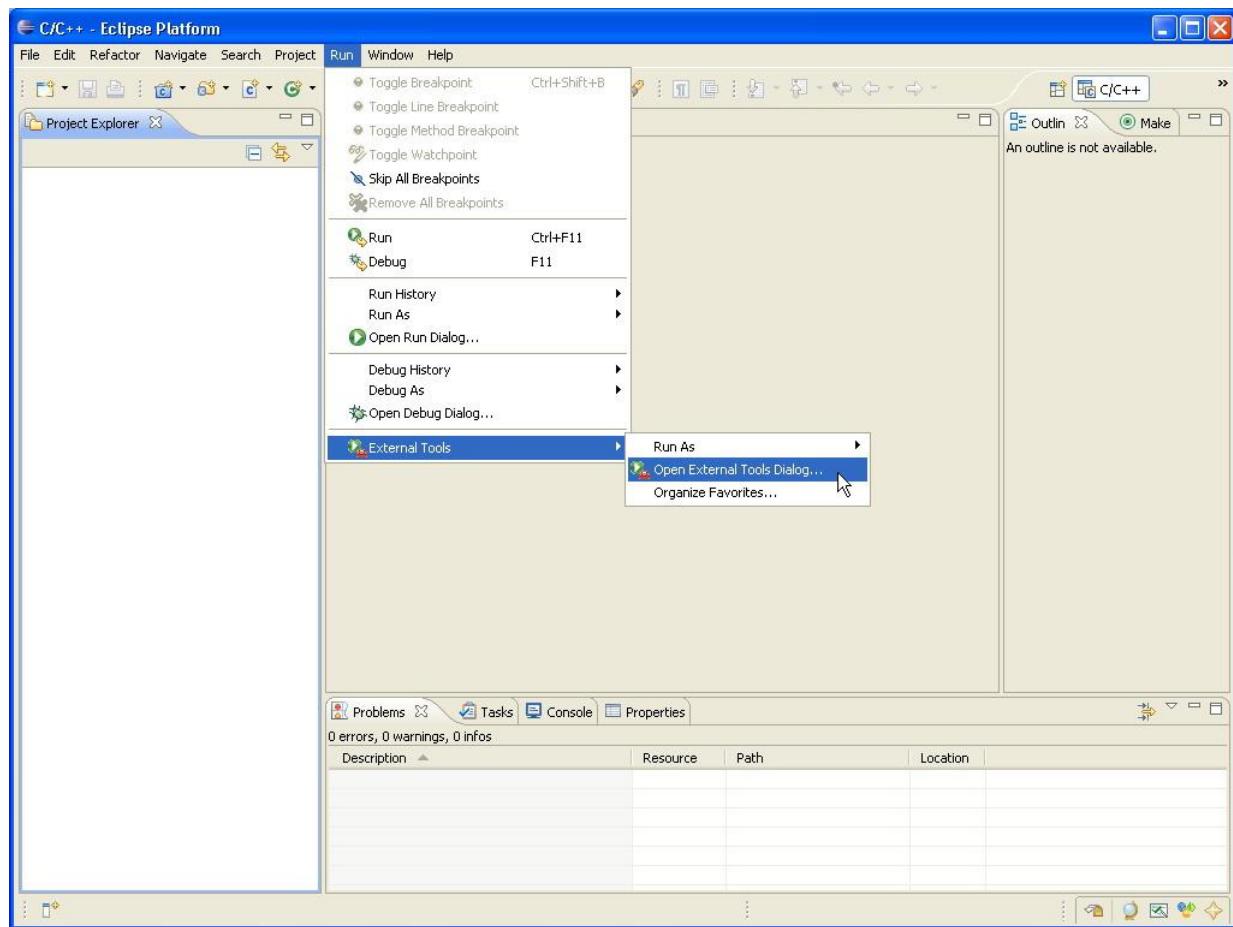

Fig 12. Steps to setting Flash magic as external tool (Step 1)

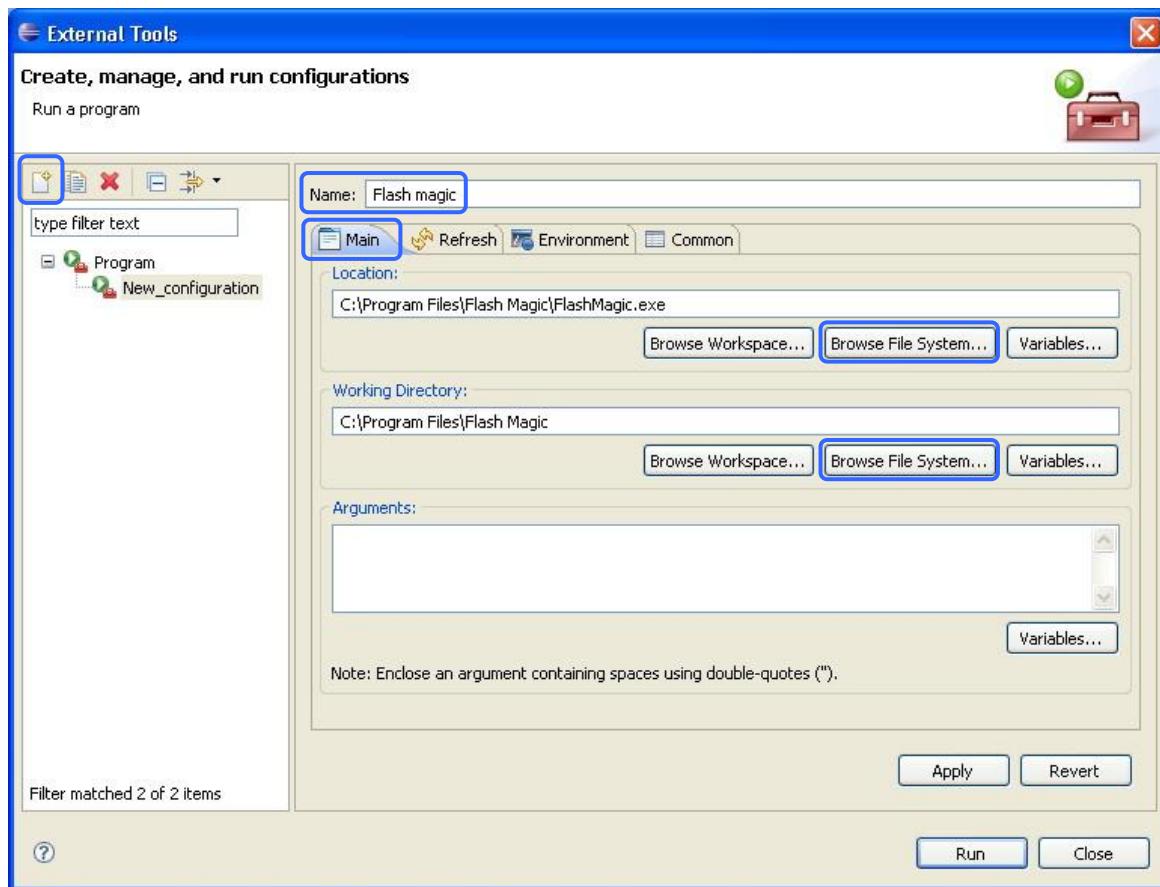

Fig 13. Steps to setting Flash magic as external tool (Step 2)

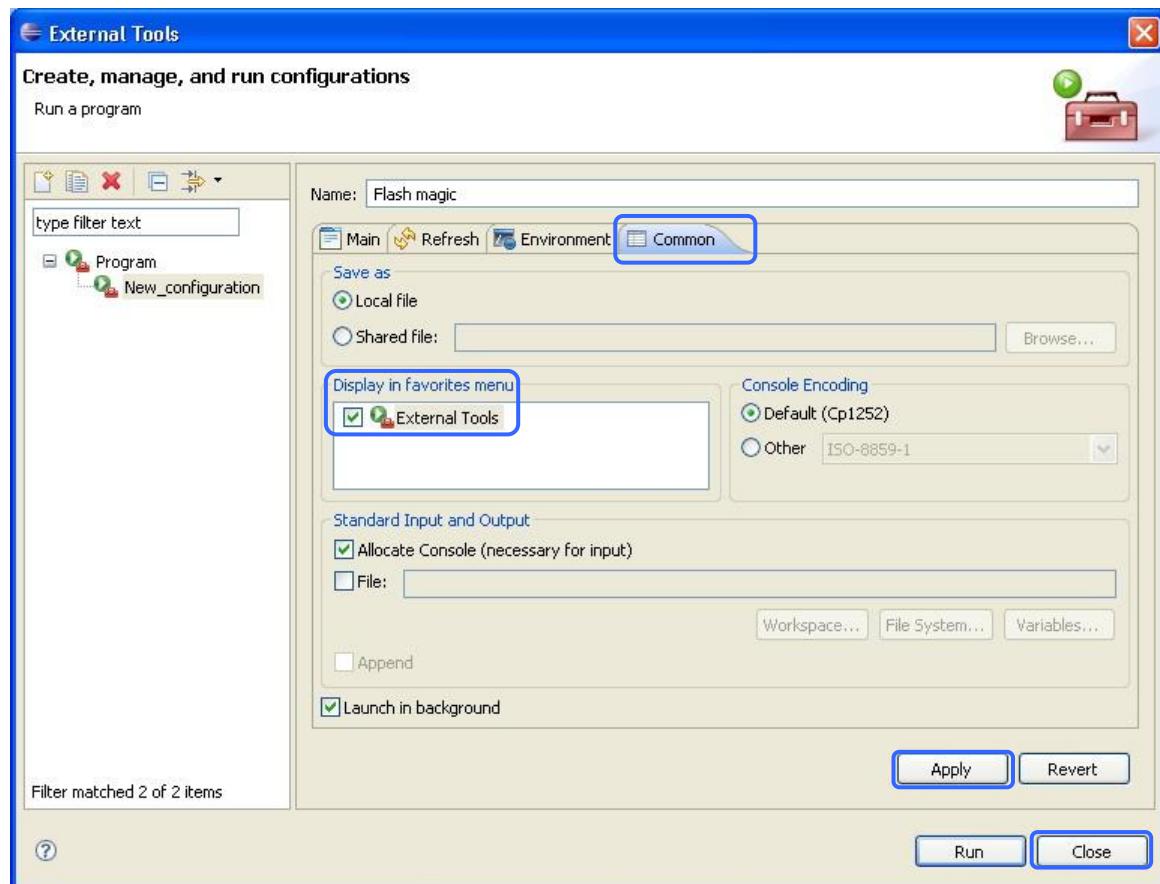

Fig 14. Steps to setting Flash magic as external tool (Step 3)

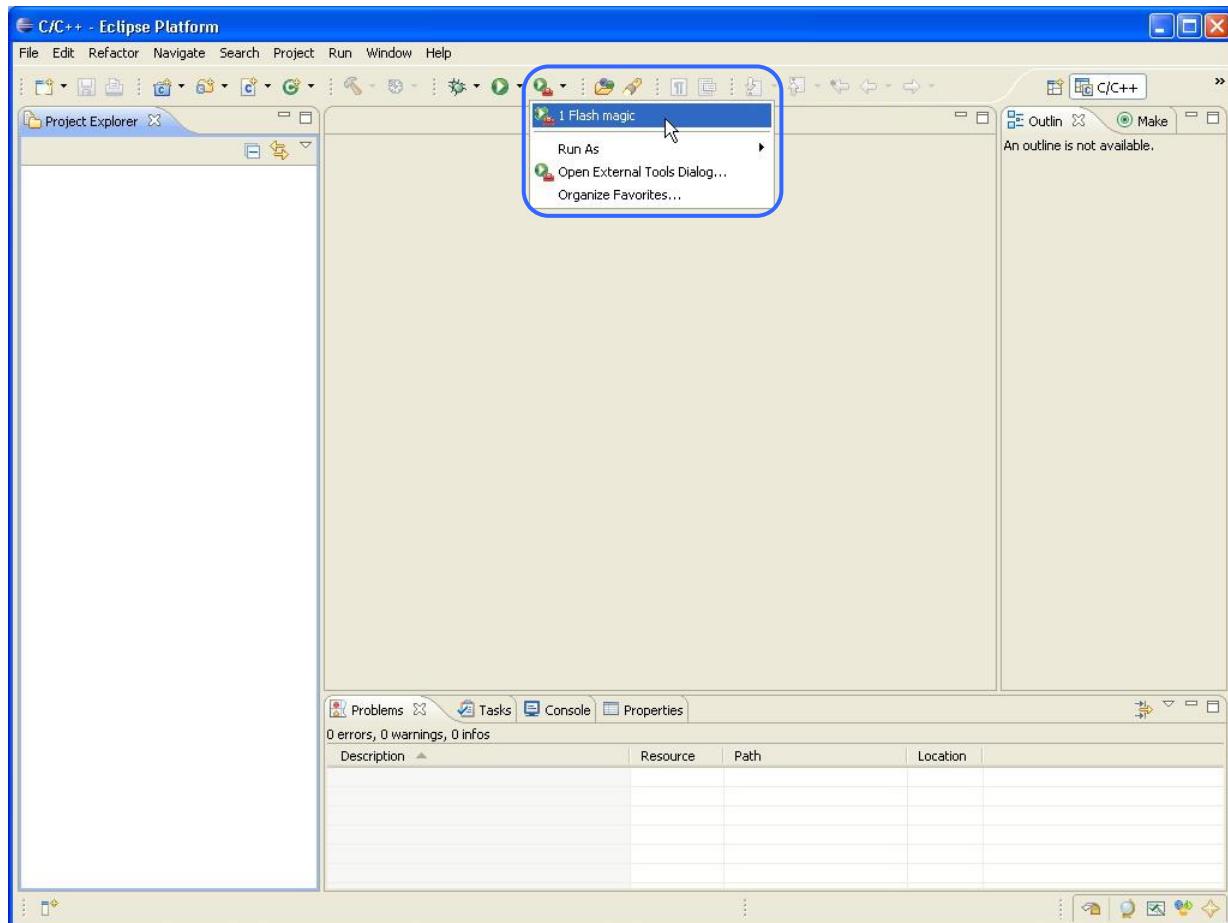

Fig 15. The result after setting

Follow the above steps to add other tools

#### GDB server

Located at directory that Jlink was installed, such as: "C:\Program Files\SEGGER\JlinkARM\_Vxxx\JlinkGDBServer.exe"

Where Vxxx is the Jlink version that using

Ex: JlinkARM\_V408, JLinkARM\_V409j

**Note:** If you want to use SWD debug mode (for LPC13xx and LPC11xx devices only support SWD), include "-if SWD" in Argument tab in External Tools Configurations of gdb program as shown in Fig 16.

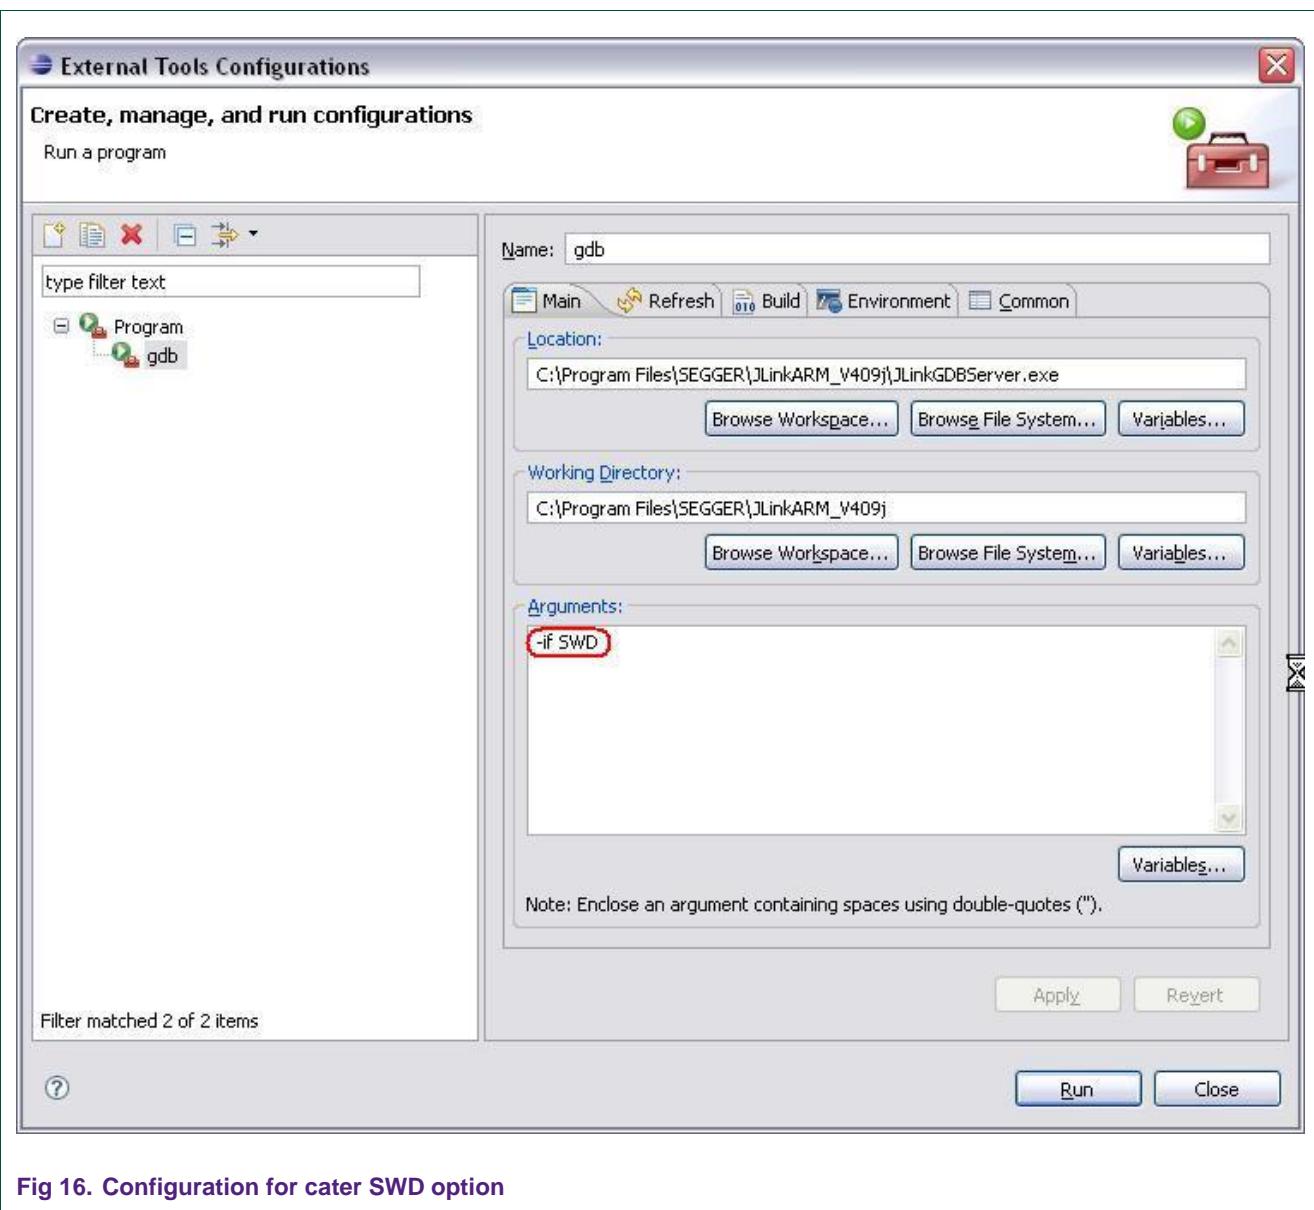

Fig 16. Configuration for cater SWD option

### Serial terminal

Located at C:\Program Files\Windows NT”.

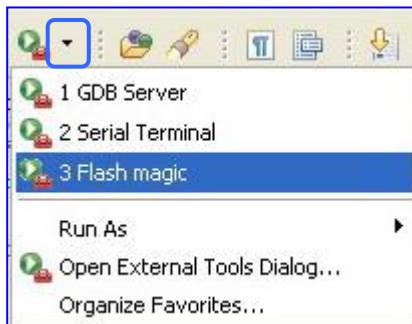

Fig 17. The result after all external tools setting

## 4. Creating and working with LPC1000CMSIS project

These following steps demonstrate how to build examples in project with CodeSourcery Lite/GNU toolchain in Eclipse IDE:

The project we used to represent here is LPC1700CMSIS. Other LPC1000CMSIS project are correlative.

### 4.1 Create new workspace

In this case, a “nxpdrv” workspace is created on C:\ drive.

### 4.2 Create new project

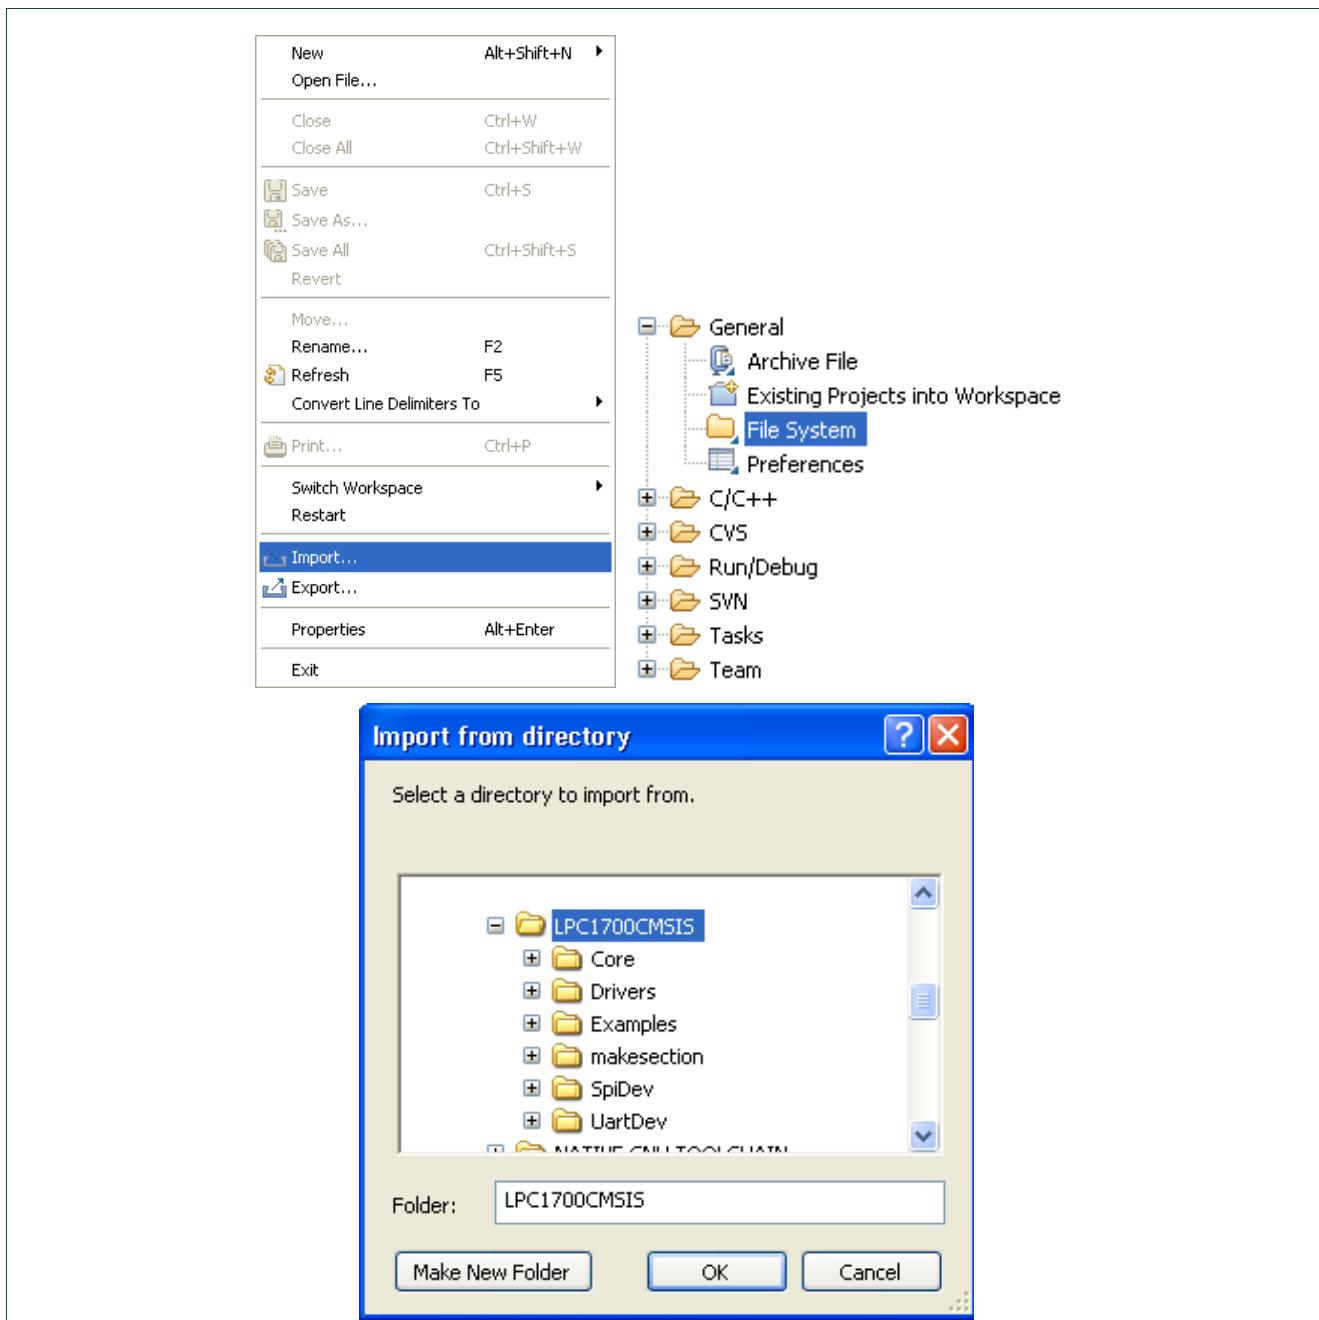

In this case, a new project is created with the name “**LPC1700CMSIS**”.

### 4.3 Extract the package

In this case, the “zip” package is extracted on D:\ driver, a folder named “**LPC1700CMSIS**” will be generated on D:\ drive.

### 4.4 Import package resource file into project

Import all the source files in project package (File → Import... → Choose File System → Browse to D:\LPC1700CMSIS)

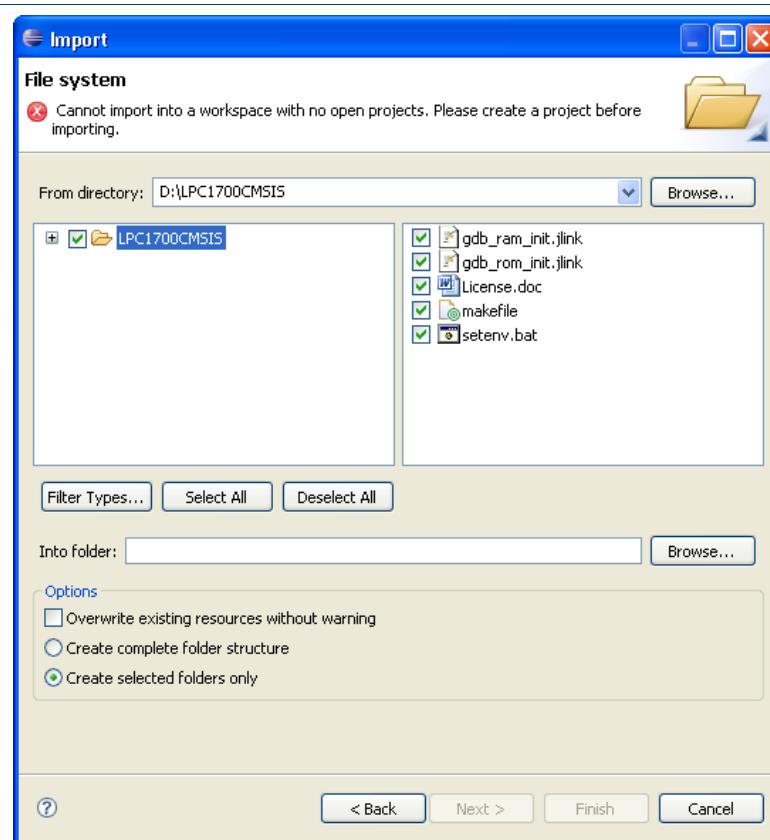

Fig 18. Import File system in resource package

The result should be like this on the left window (project window):

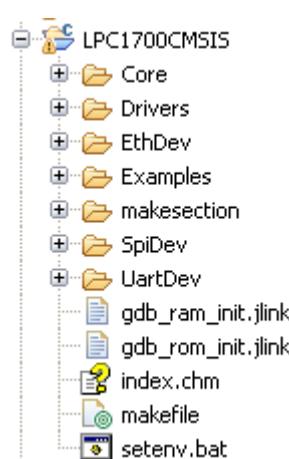

Fig 19. Result at the left window (Project window) after importing

Configure "make" environment: Open "makeconfig" file and edit the "PROJ\_ROOT" symbol as shown in [Fig 20](#):

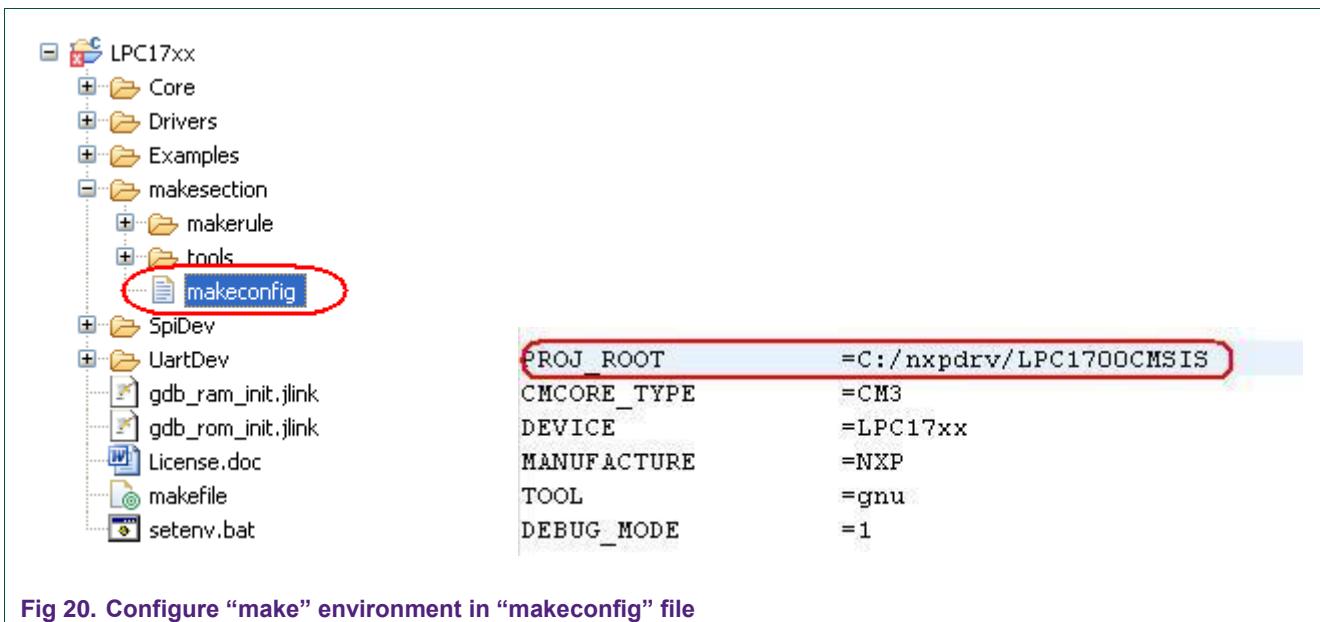

Fig 20. Configure “make” environment in “makeconfig” file

(In this case, “nxpdrv” means the eclipse workspace that was created first, and “LPC1700CMSIS” is the name of this project; note the **forward slash** style is used).

Close the Eclipse IDE.

#### 4.5 Configure environment of “make utility”

In this case, all “make tool” resides in <C:/nxpdrv/LPC1700CMSIS/makesection/tools>

In order to make the system recognize the command located in private tool that its path is not included in the existing PATH variable of the system and user environment, the user must set the path of private tool to the “path” variable of the system variable environment.

In each project after importing the file system, all of the required tools are in the in “tools” folder; the user must set the path of the “tools” at the head of the “path” in system variables.

Note: Make sure all old paths of previous similar utility tools are removed in both user and system variables.

- On desktop, go to Start → Control Panel → System...

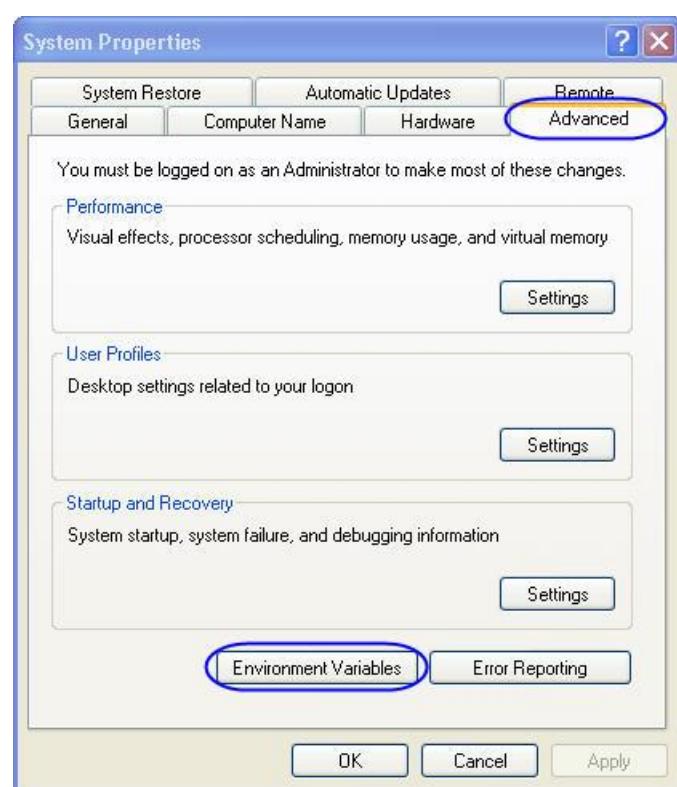

Fig 21. Environment configuration (Step 1)

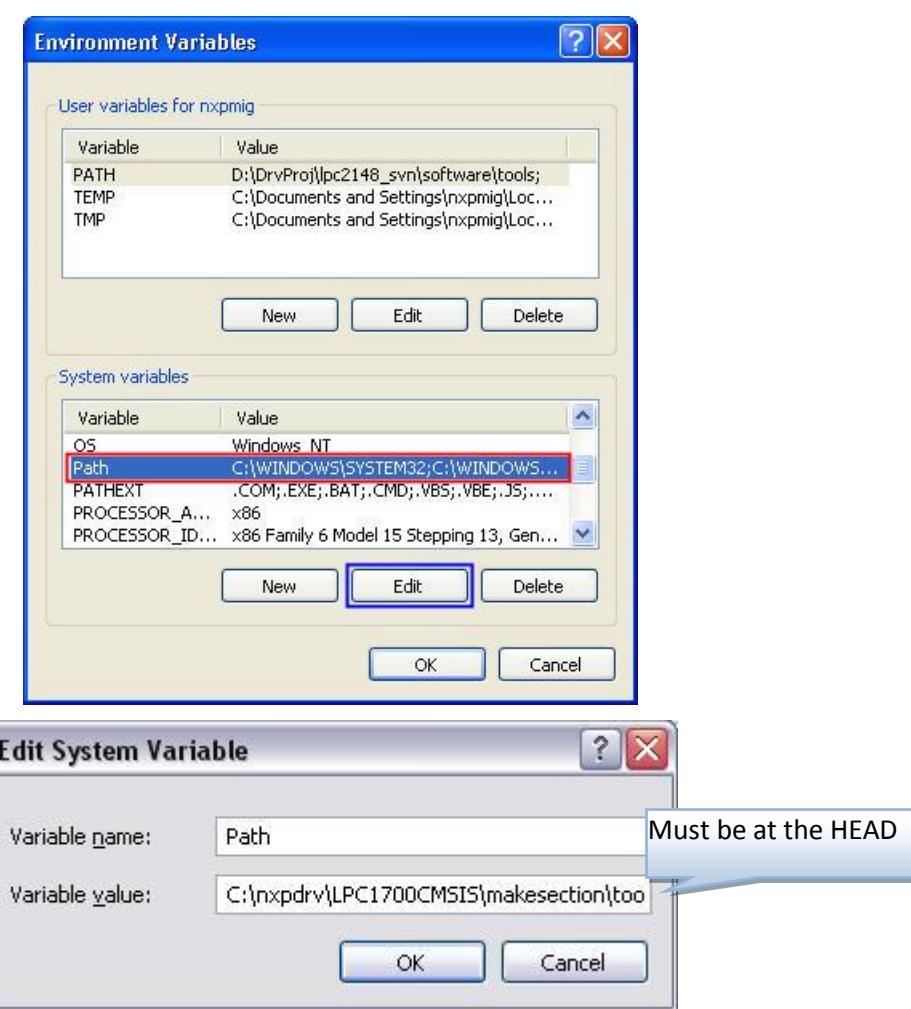

Fig 22. Environment configuration (Step 2)

#### 4.6 Compile project

Re-open Eclipse, and then go through Project → Property... to configure the properties for the "LPC1700CMSIS" project as shown in [Fig 23](#):

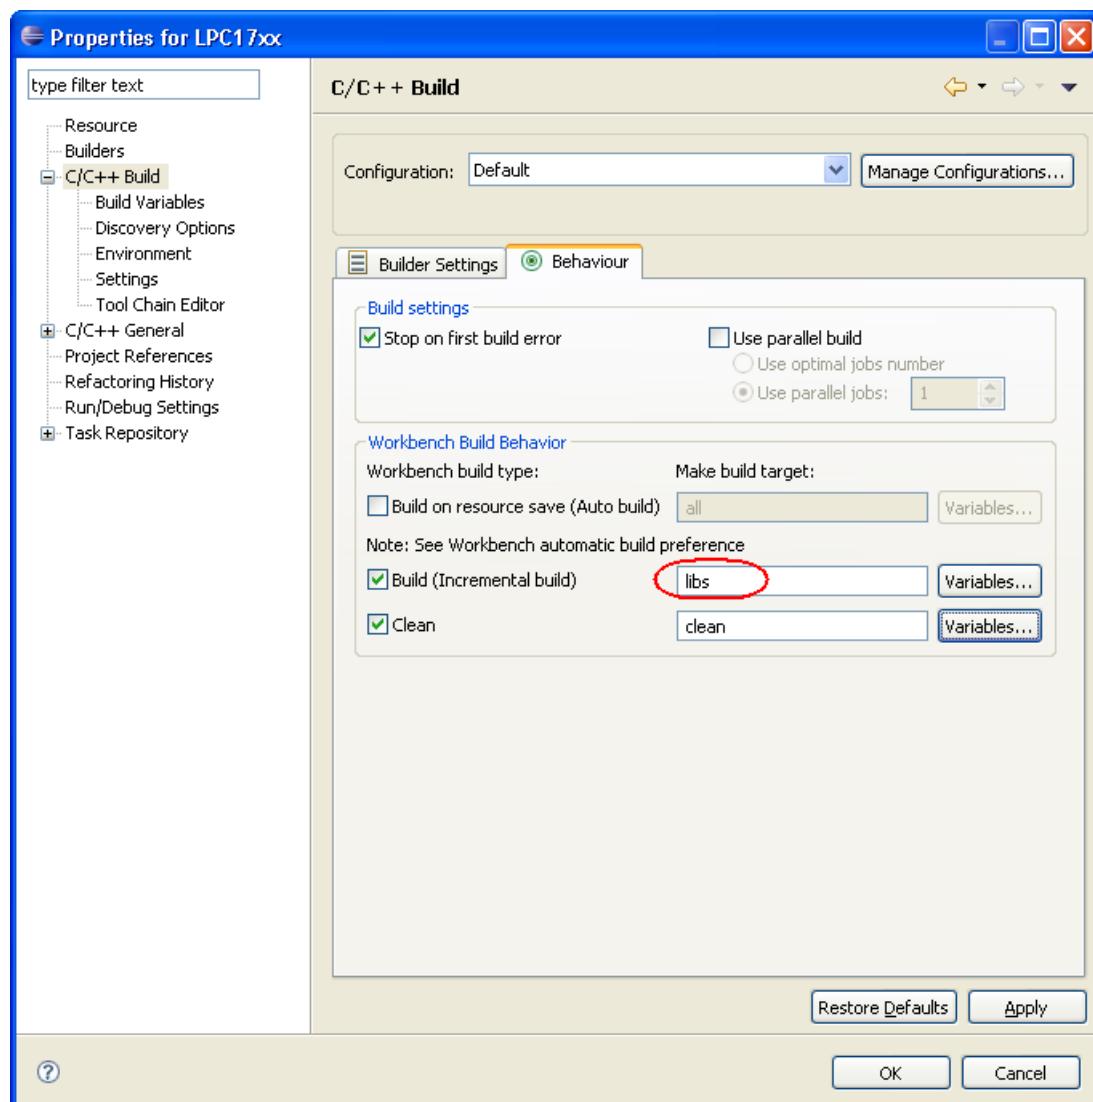

Fig 23. Configure “libs” for compiling entire project mode

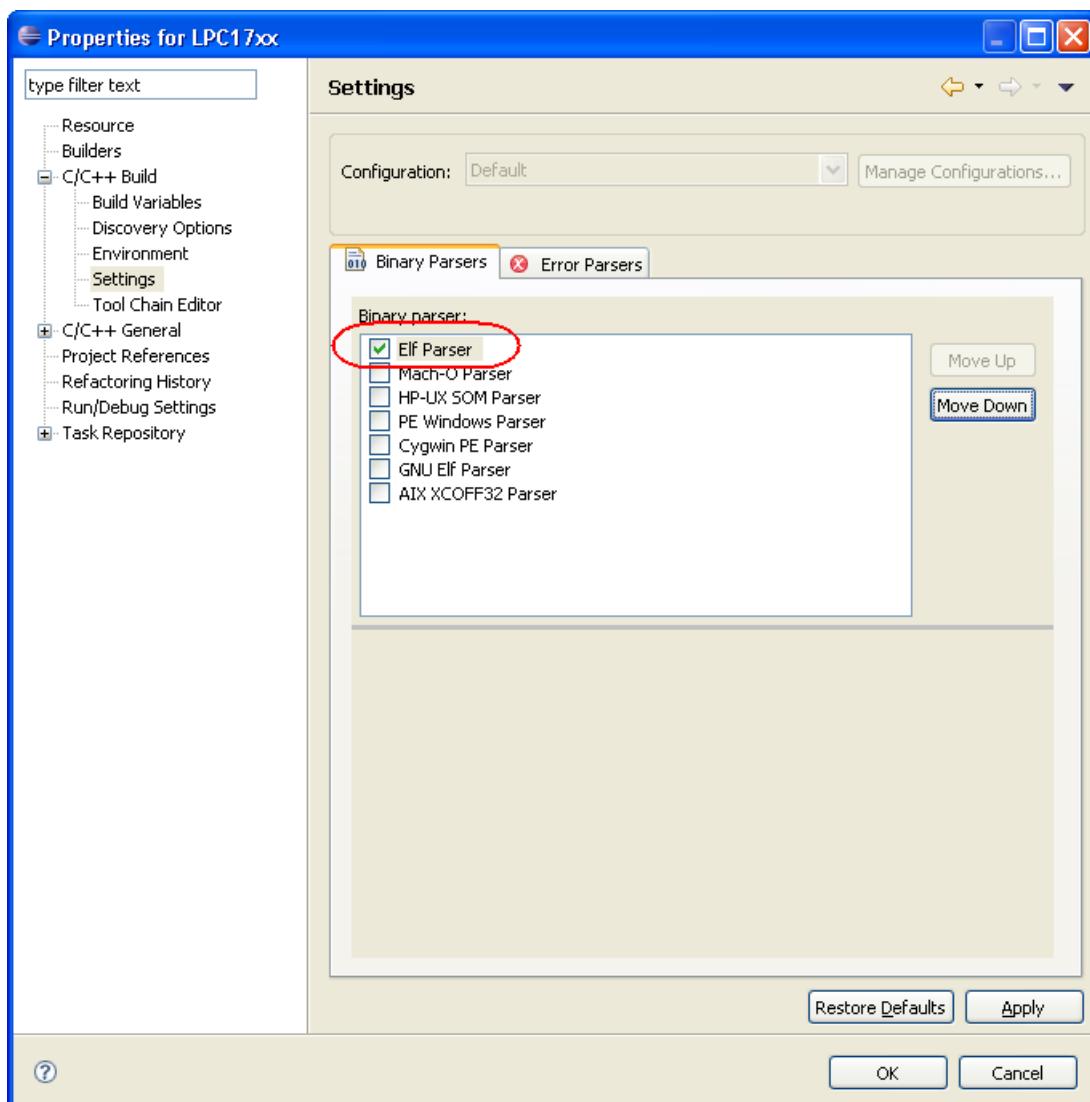

Fig 24. Check this option to allow .elf file to be recognized

Now, build entire the project...

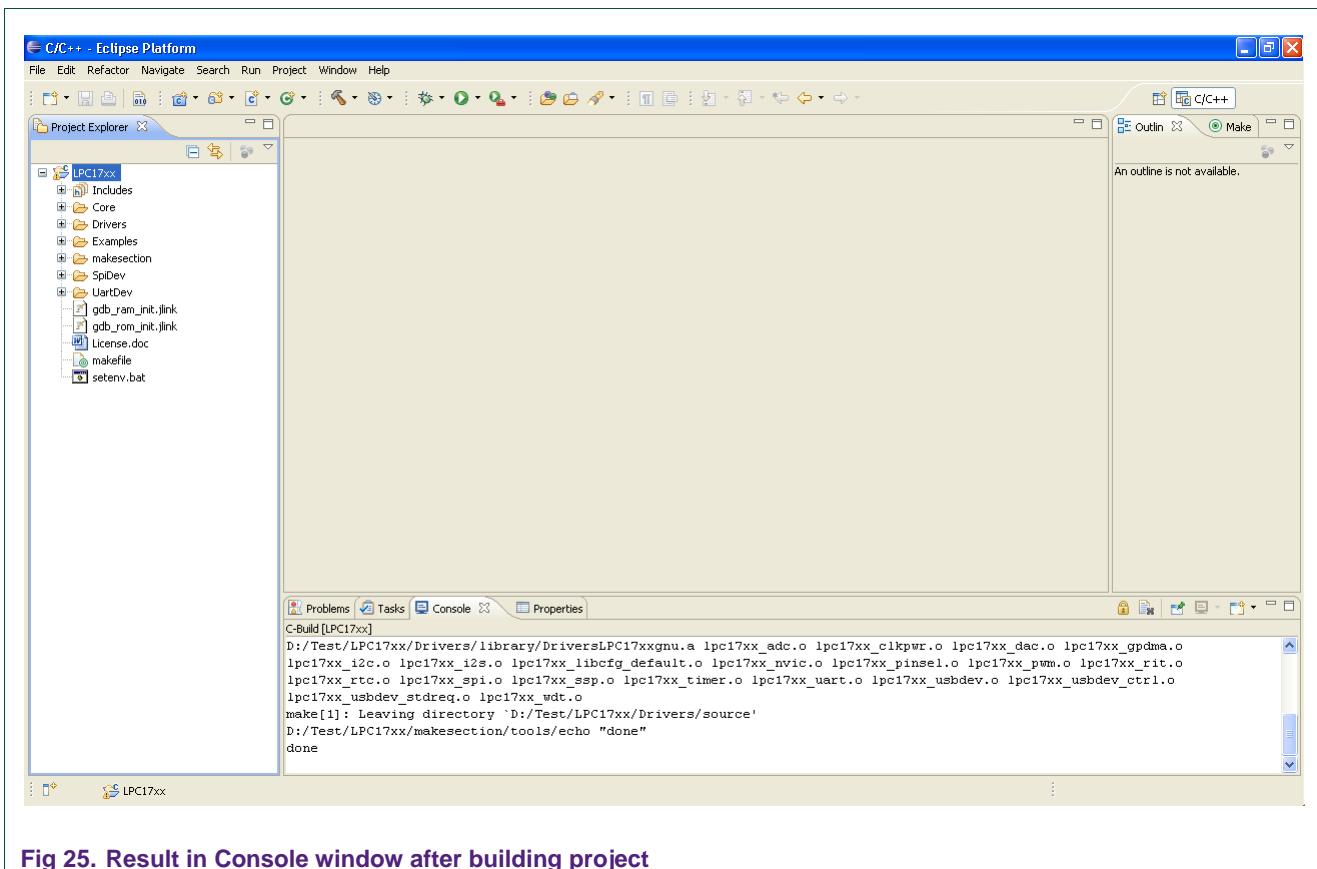

Fig 25. Result in Console window after building project

To build the example, right click on the root of that example → Make target → Build...

(Note: In this case, the example is placed at [C:\nxpdrv\LPC1700CMSIS\Examples](#), for each peripheral. There are some sub-folders that contain specific examples for various purposes to test this peripheral)

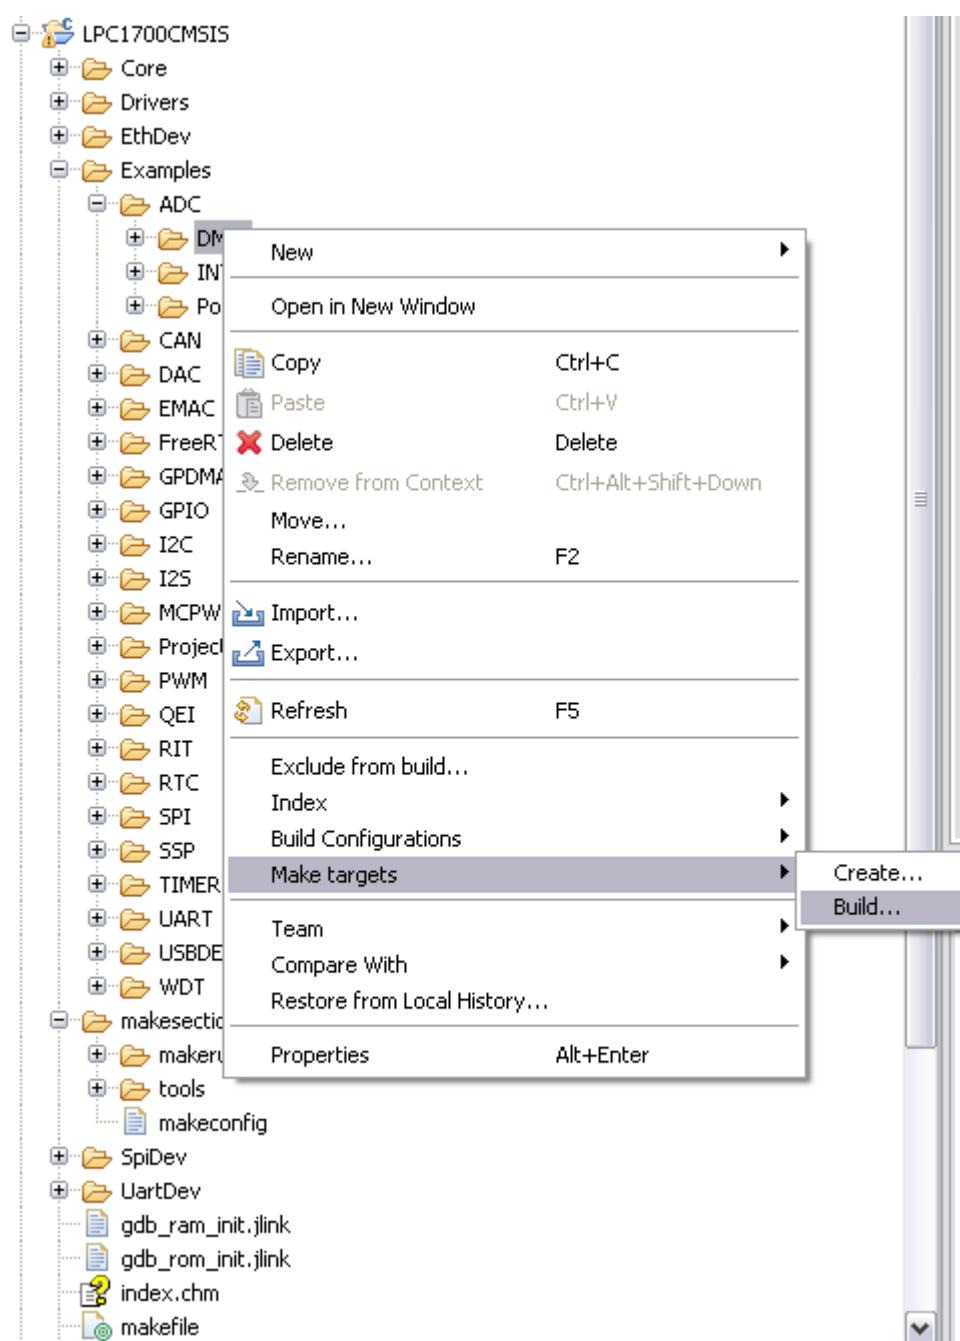

Fig 26. Create “make target” for each example (1)

Create these “make target”: “ram” and “rom”...

- RAM mode, target name is 'ram'
- ROM mode, target name is 'rom'

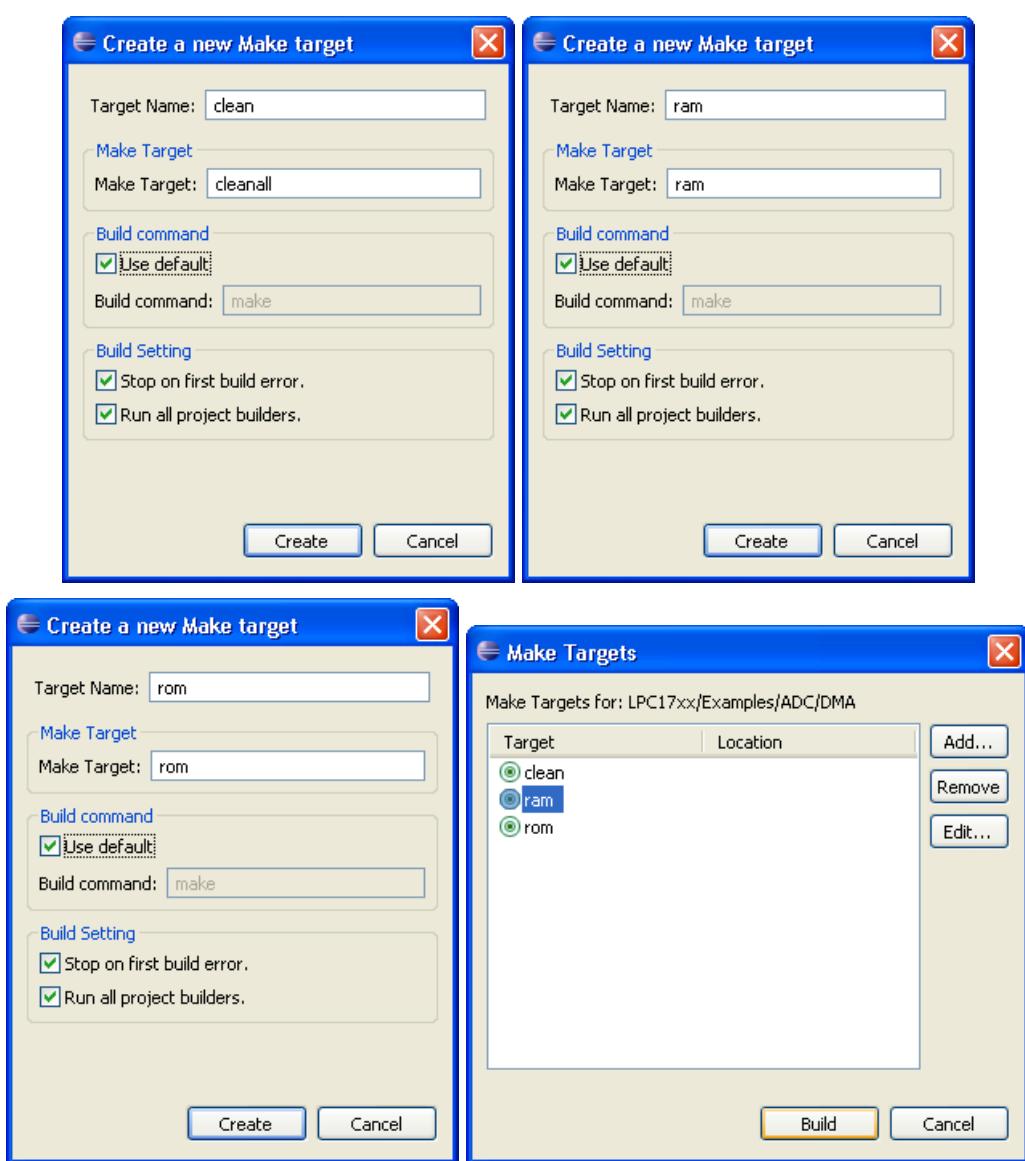

Fig 27. Create “make target” for each example (2)

Now, build the example in ram mode...

The result should like the example shown in [Fig 28](#) after building successfully at the left window (Project window).

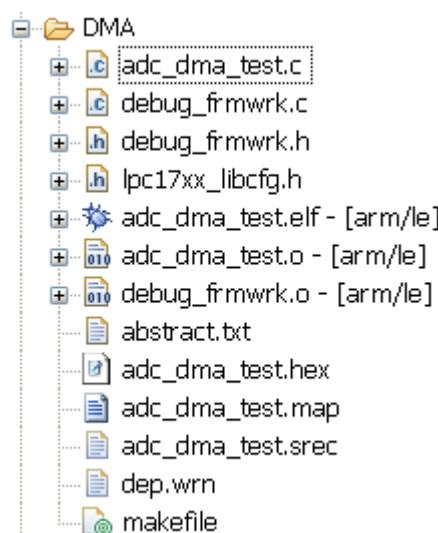

Fig 28. Result after building the “DMA” example

**Tip**

Open “Make Targets” viewer to manage projects easier.

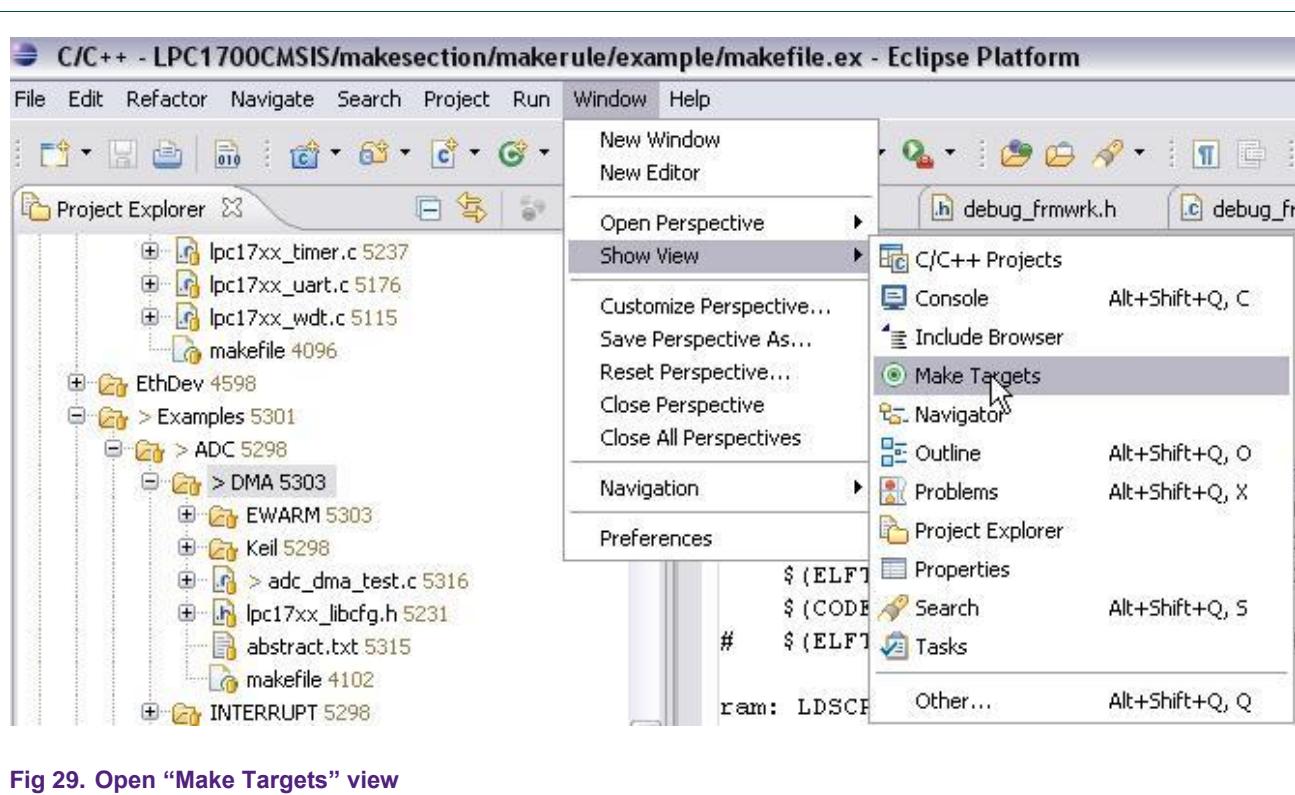

Fig 29. Open “Make Targets” view

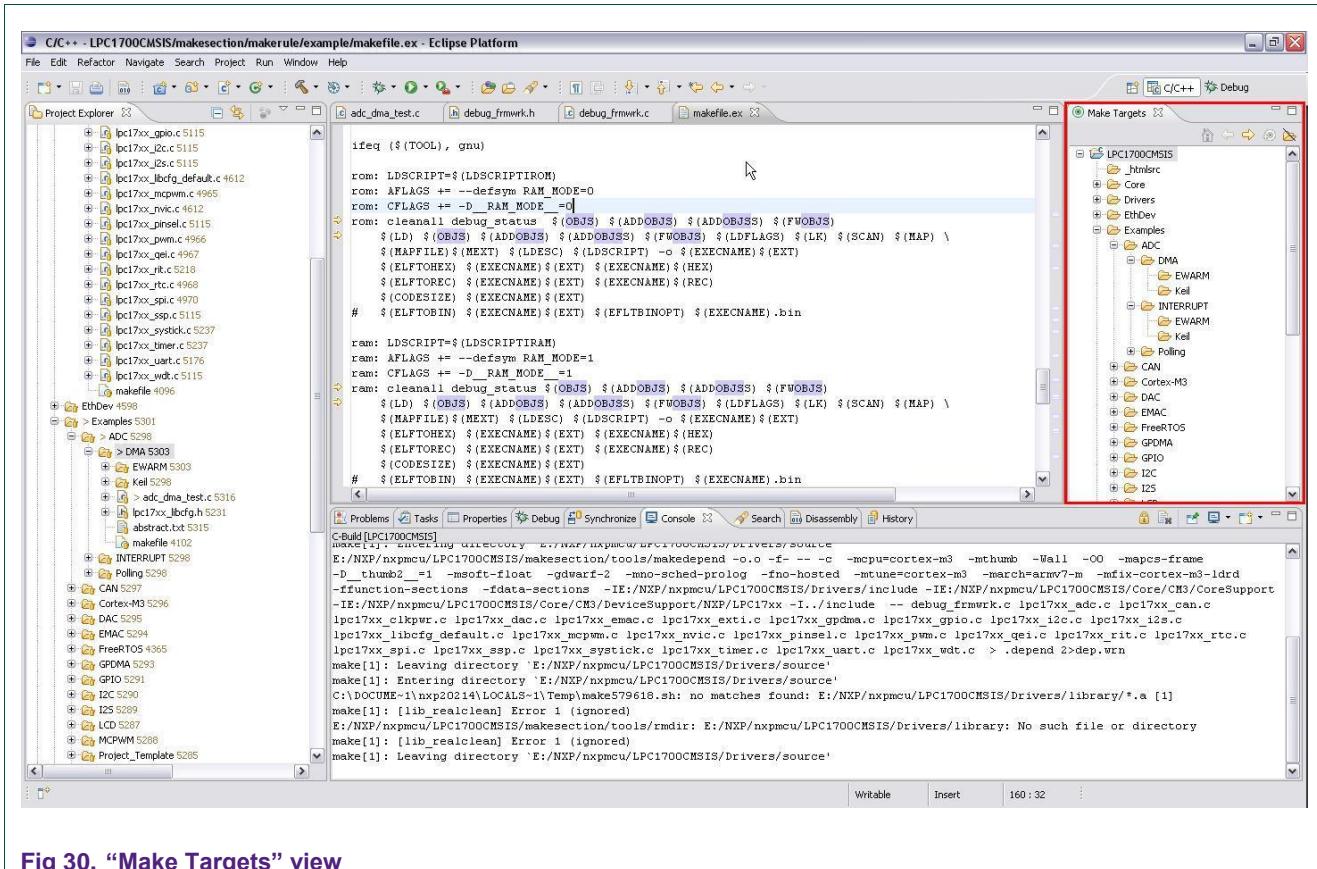

Fig 30. "Make Targets" view

- Right click in example on "Make Targets" view to create target
- Double click in example target to build/clean project.

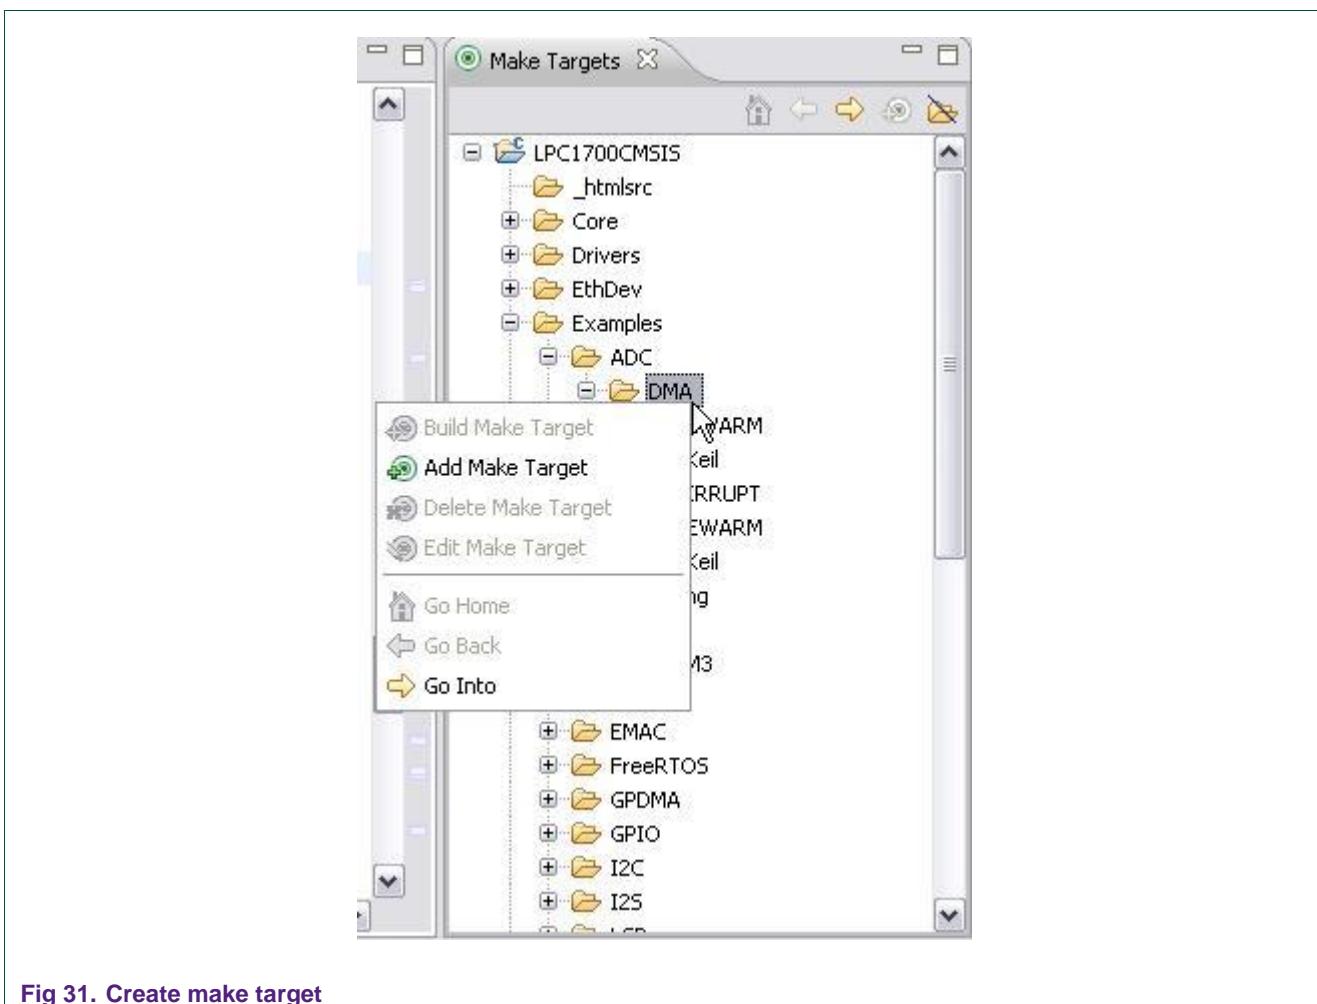

Fig 31. Create make target

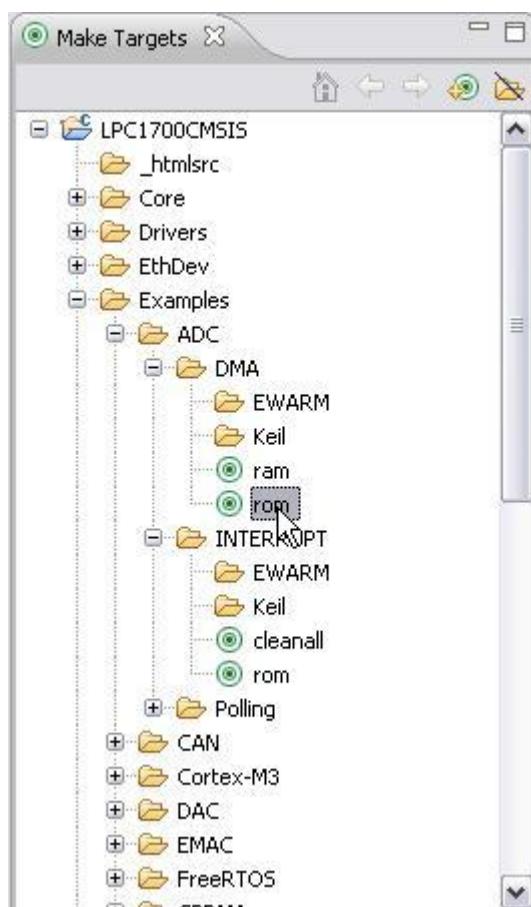

Fig 32. Run target

#### 4.7 Remove unused sections

“`--gc-section`” is the flag supported by GNU to remove unused sections. It could reduce code size.

Uncomment this flag in ‘make.LPC17xx.gnu’ placed at ‘..\\makesection\\LPC17xx’ folder.

```
LK          = -static -mcpu=cortex-m3 -mthumb -mthumb-interwork
#LK
#LK          = -static
#LK          += -Wl,--start-group $(TARGET_FWLIB_LIB)
LK          += -Wl,--start-group
LK          += -L$(THUMB2GNULIB) -L$(THUMB2GNULIB2)
LK          += -lc -lg -lstdc++ -lsupc++
LK          += -lgcc -lm
LK          += -Wl,--end-group
LK          += -Wl,--gc-sections -Wl,--print-gc-sections
```

Fig 33. Uncomment ‘`--gc-sections`’ flag to reduce code

**Warning:** Using this flag can affect debugger and cause it run incorrectly.

Recommend to use it just in “run standalone” mode.

Keil and IAR remove unused sections automatically. So don’t care about it if run examples in Keil and IAR

## 4.8 Execute example

### 4.8.1 ROM mode

Use Flash Magic to burn an image file (.hex) file (that can be observed only after building in ROM mode).

### 4.8.2 RAM mode

Example can be run in RAM mode only with debugger.

Debugging in RAM mode requires fewer steps than ROM mode because the image file after building in RAM mode is loaded directly into the RAM section without any external tools.

## 4.9 Debug the project

Basically, each example can be built in RAM mode or ROM (FLASH) mode.

### 4.9.1 RAM mode

Note: “make ram” must be completed before debugging in RAM mode

In this case, the “uart\_interrupt” example is used to debug in RAM mode.

- Setting up Debug session: Go to menu Run → Open Debug Dialog...

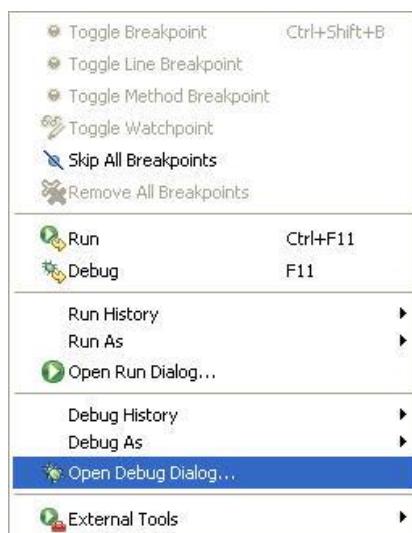

Fig 34. Open Debug dialog

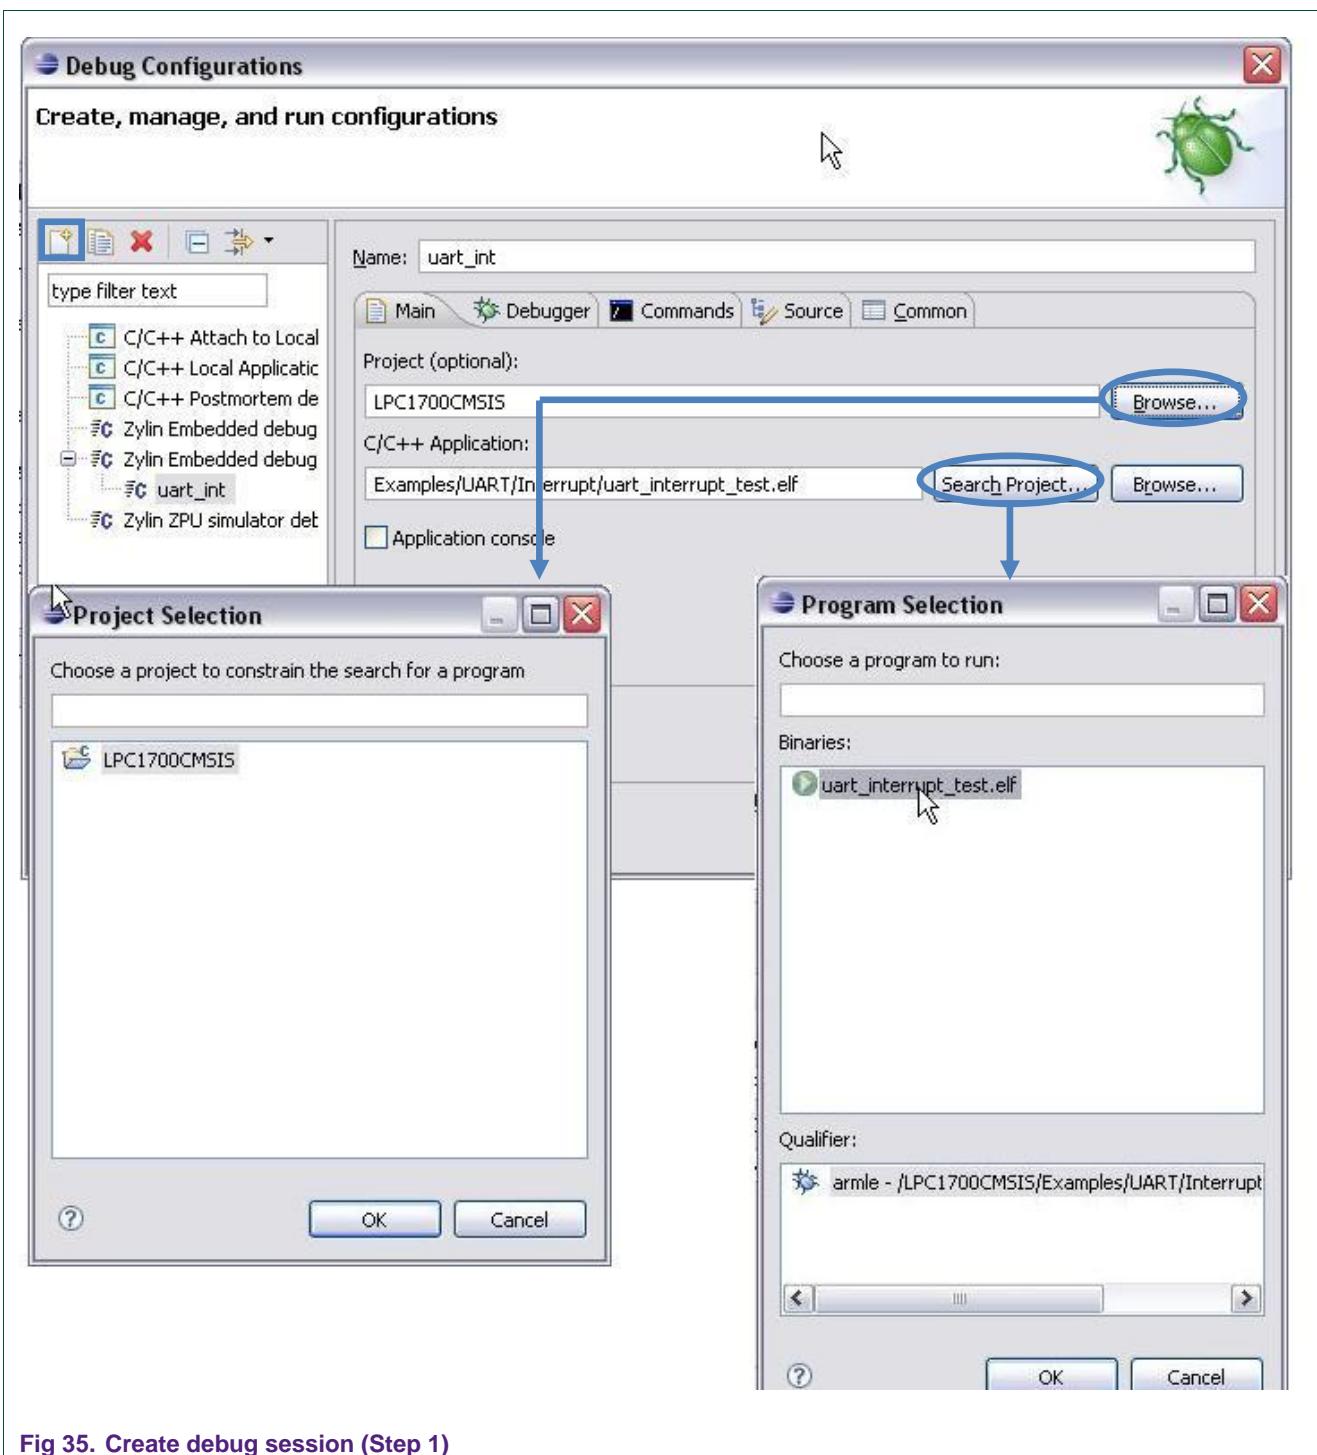

Fig 35. Create debug session (Step 1)

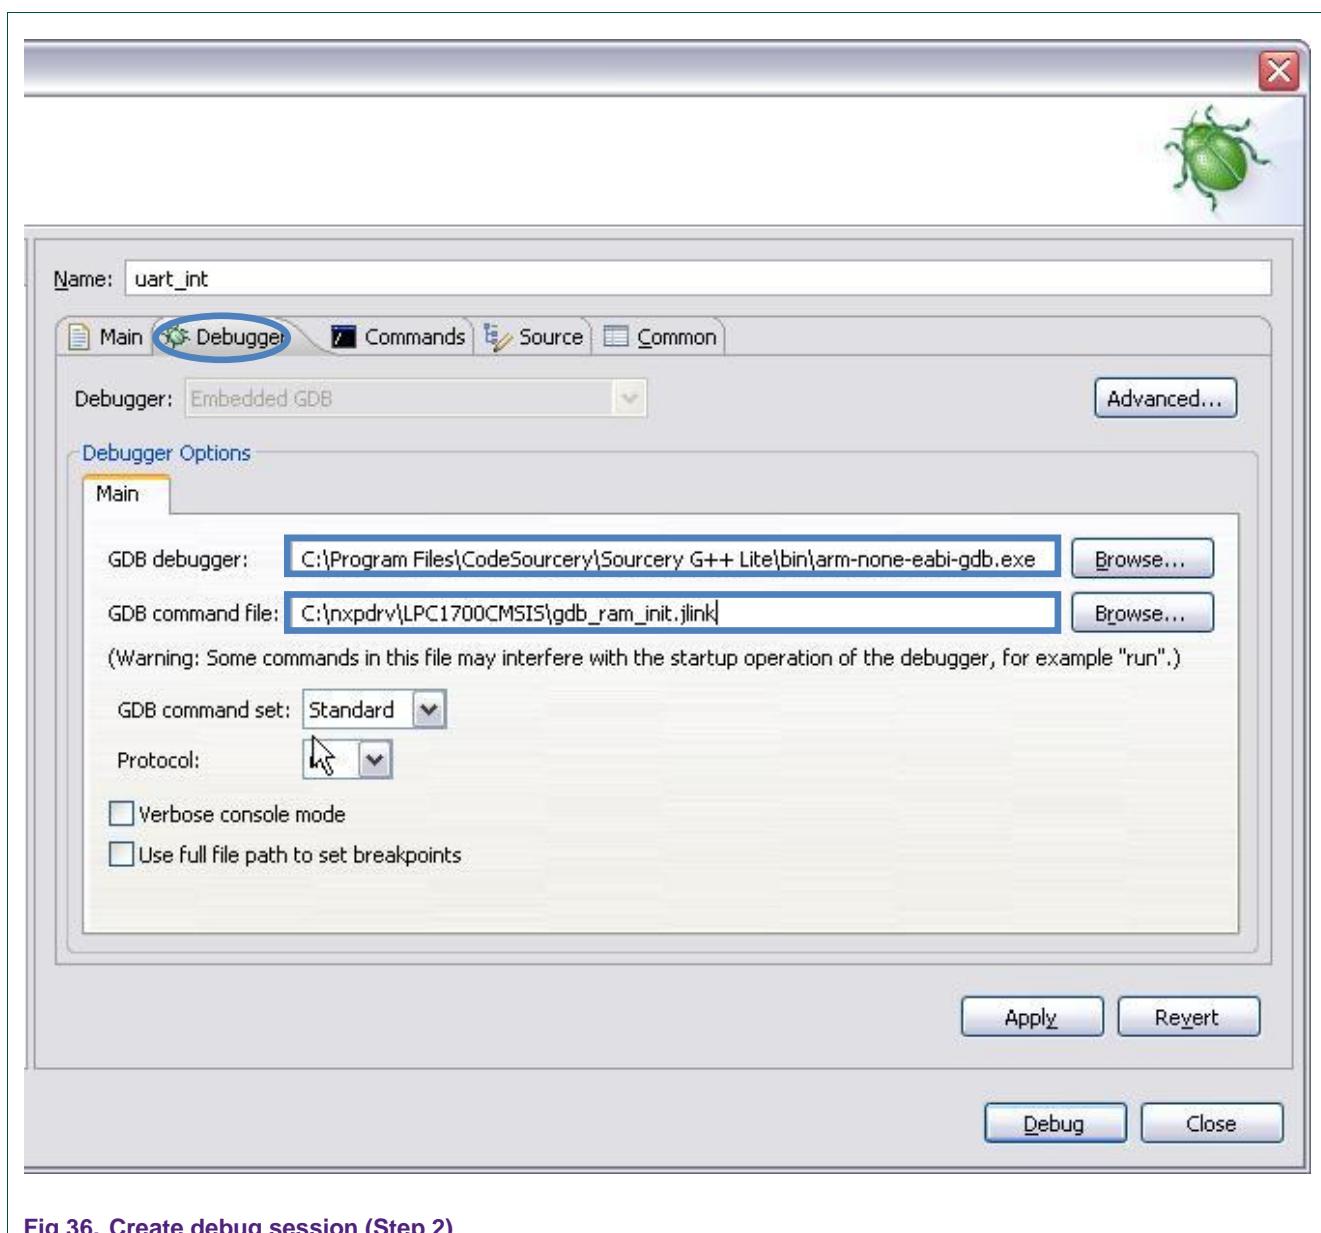

Fig 36. Create debug session (Step 2)

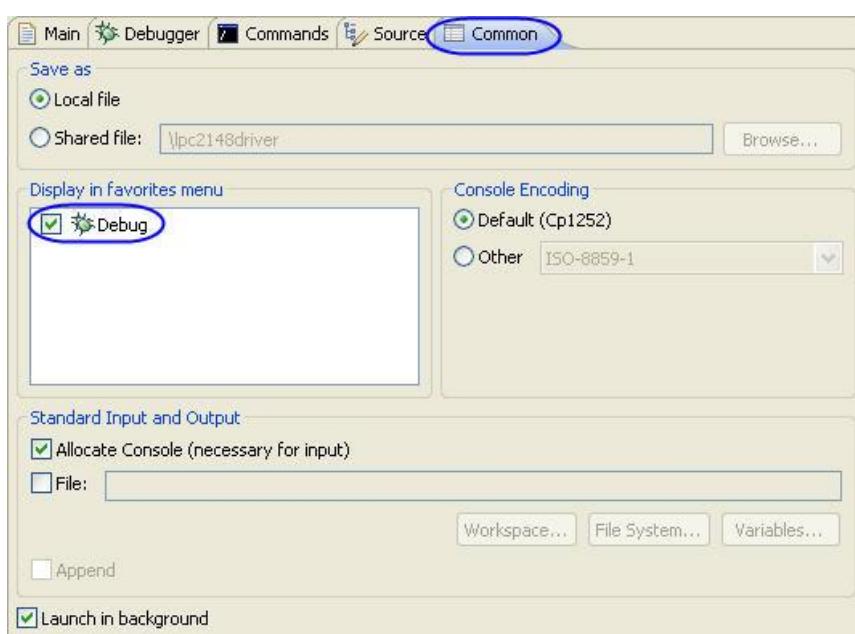

Fig 37. Create debug session (Step 3)

- Debugging in RAM mode (Note: Open “uart\_interrupt\_test.c” file to set breakpoint in next step).

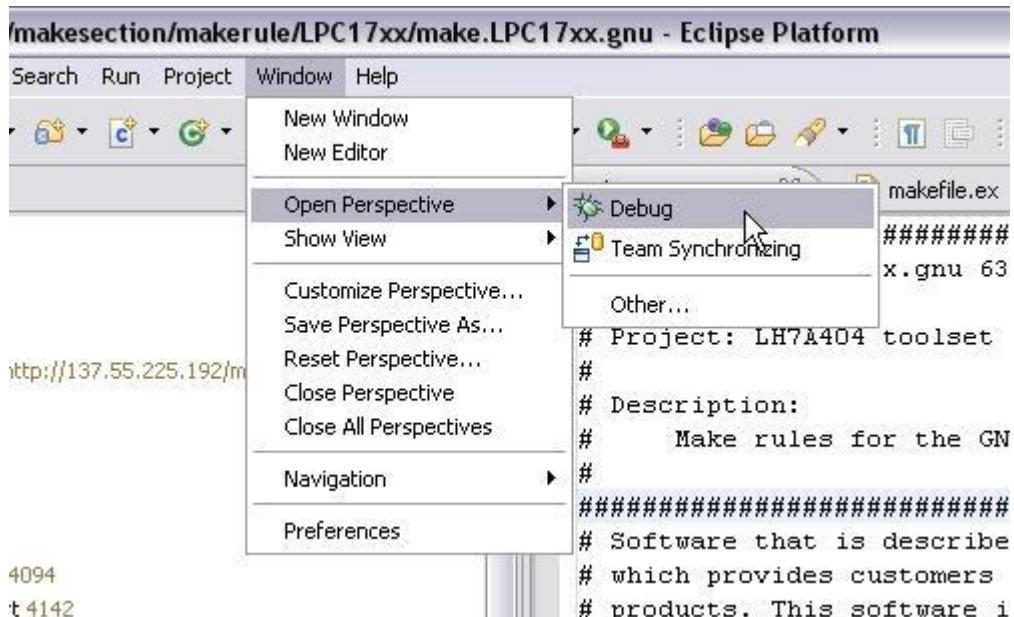

Fig 38. Open Perspective to debug window

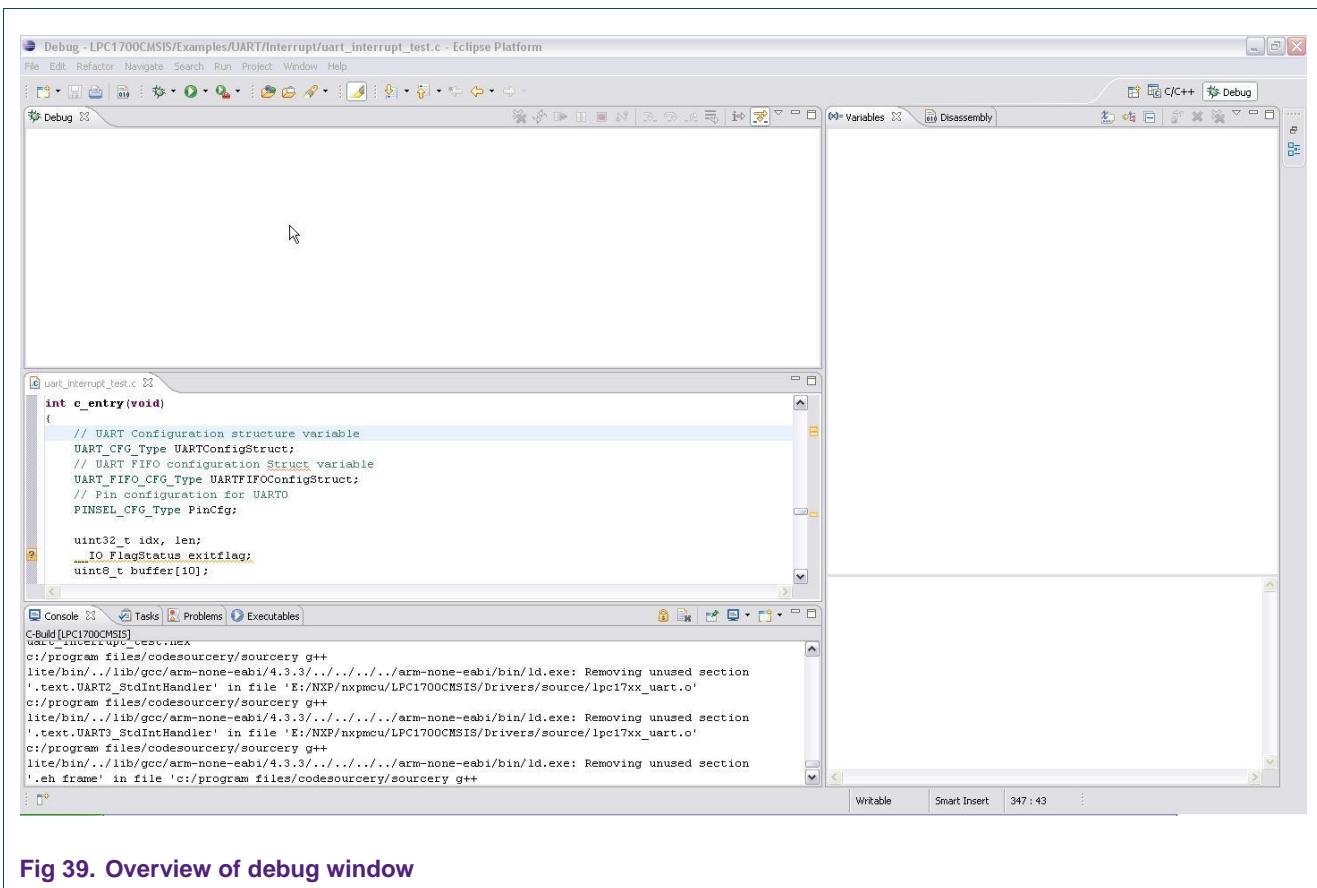

Fig 39. Overview of debug window

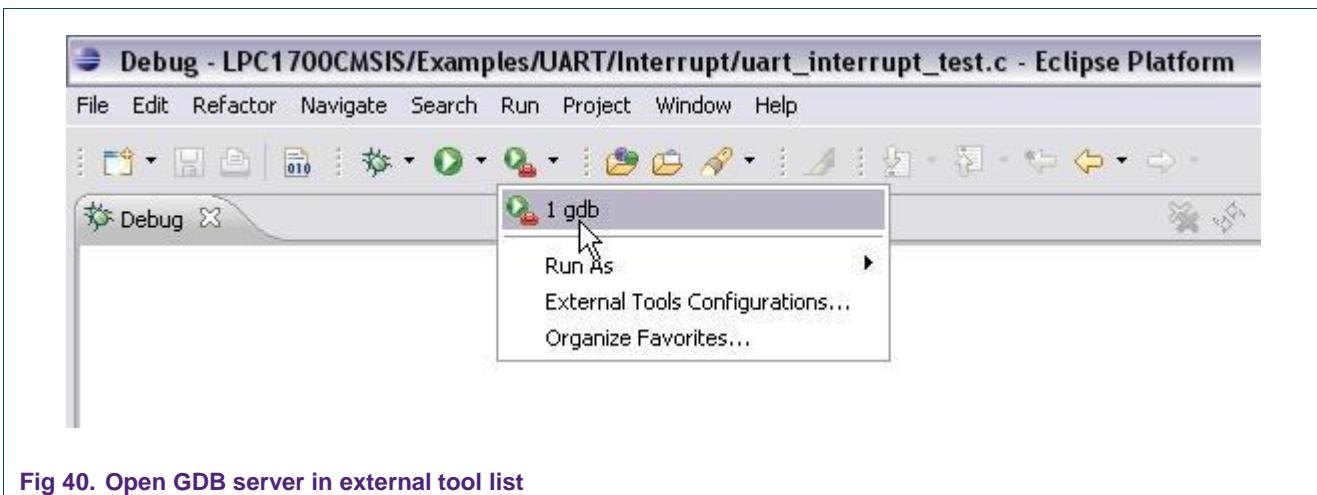

Fig 40. Open GDB server in external tool list

Fig 41. Start in free mode

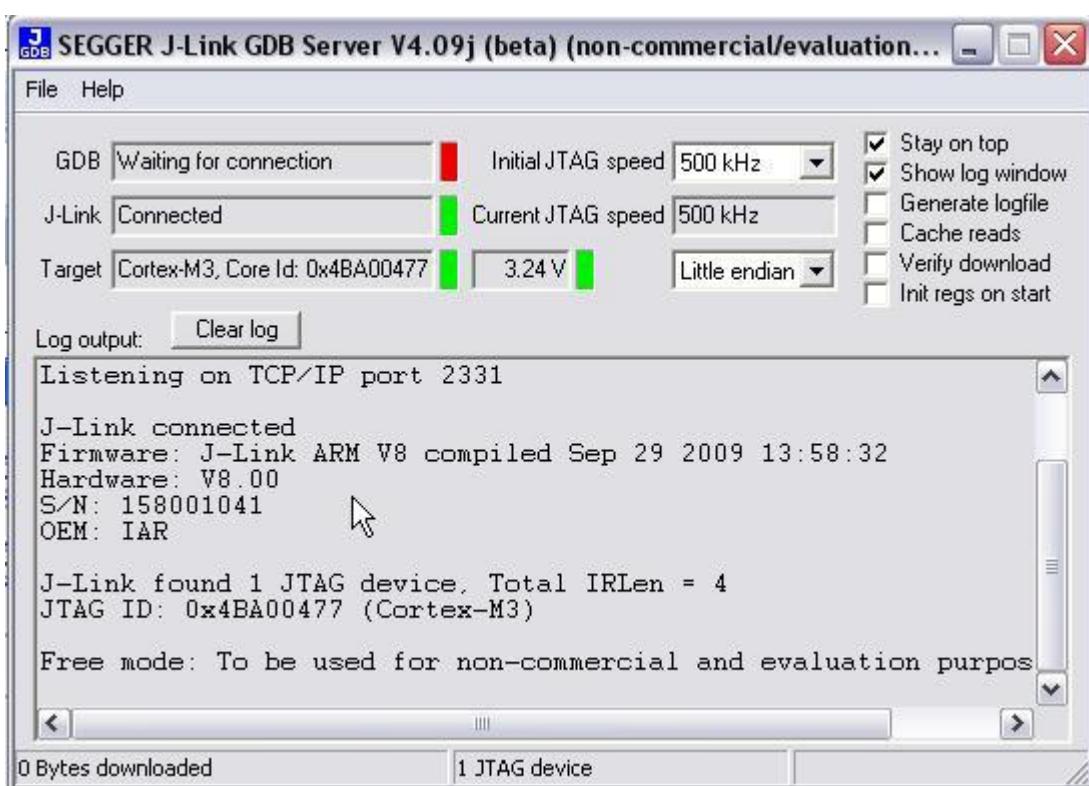

Fig 42. Configure parameter on J-link GDB server

**Note:** Remember configure for SEGGER J-link run in “little endian” mode

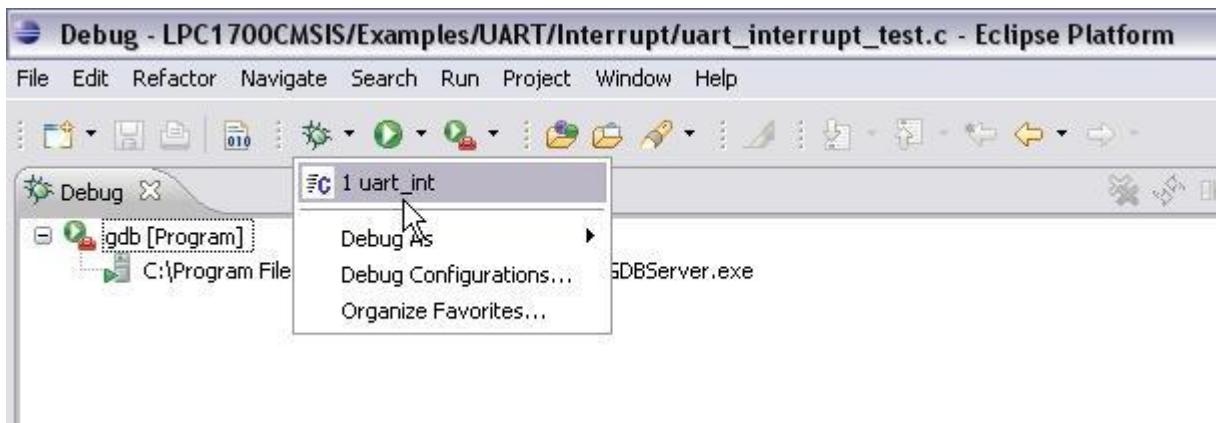

Fig 43. Open uart\_interrupt\_test debug session

Fig 44. All function buttons

A screenshot of the Eclipse code editor showing the file "uart\_interrupt\_test.c". The code initializes the NVIC and SCBNVIC, configures the NVIC Preemption Priority Bits, sets the Vector table offset value, and handles RAM mode. A blue circular breakpoint marker is placed on the first line of code. The code editor has a standard Windows-style interface with tabs, scroll bars, and a status bar at the bottom.

```
// DeInit NVIC and SCBNVIC
NVIC_DeInit();
NVIC_SCBDeInit();

/* Configure the NVIC Preemption Priority Bits:
 * two (2) bits of preemption priority, six (6) bits of sub-priority.
 * Since the Number of Bits used for Priority Levels is five (5), so the
 * actual bit number of sub-priority is three (3)
 */
NVIC_SetPriorityGrouping(0x05);

// Set Vector table offset value
#if (_RAM_MODE_ ==1)
    NVIC_SetVTOR(0x10000000);
#else
```

Fig 45. Set a break-point on uart\_int.c file

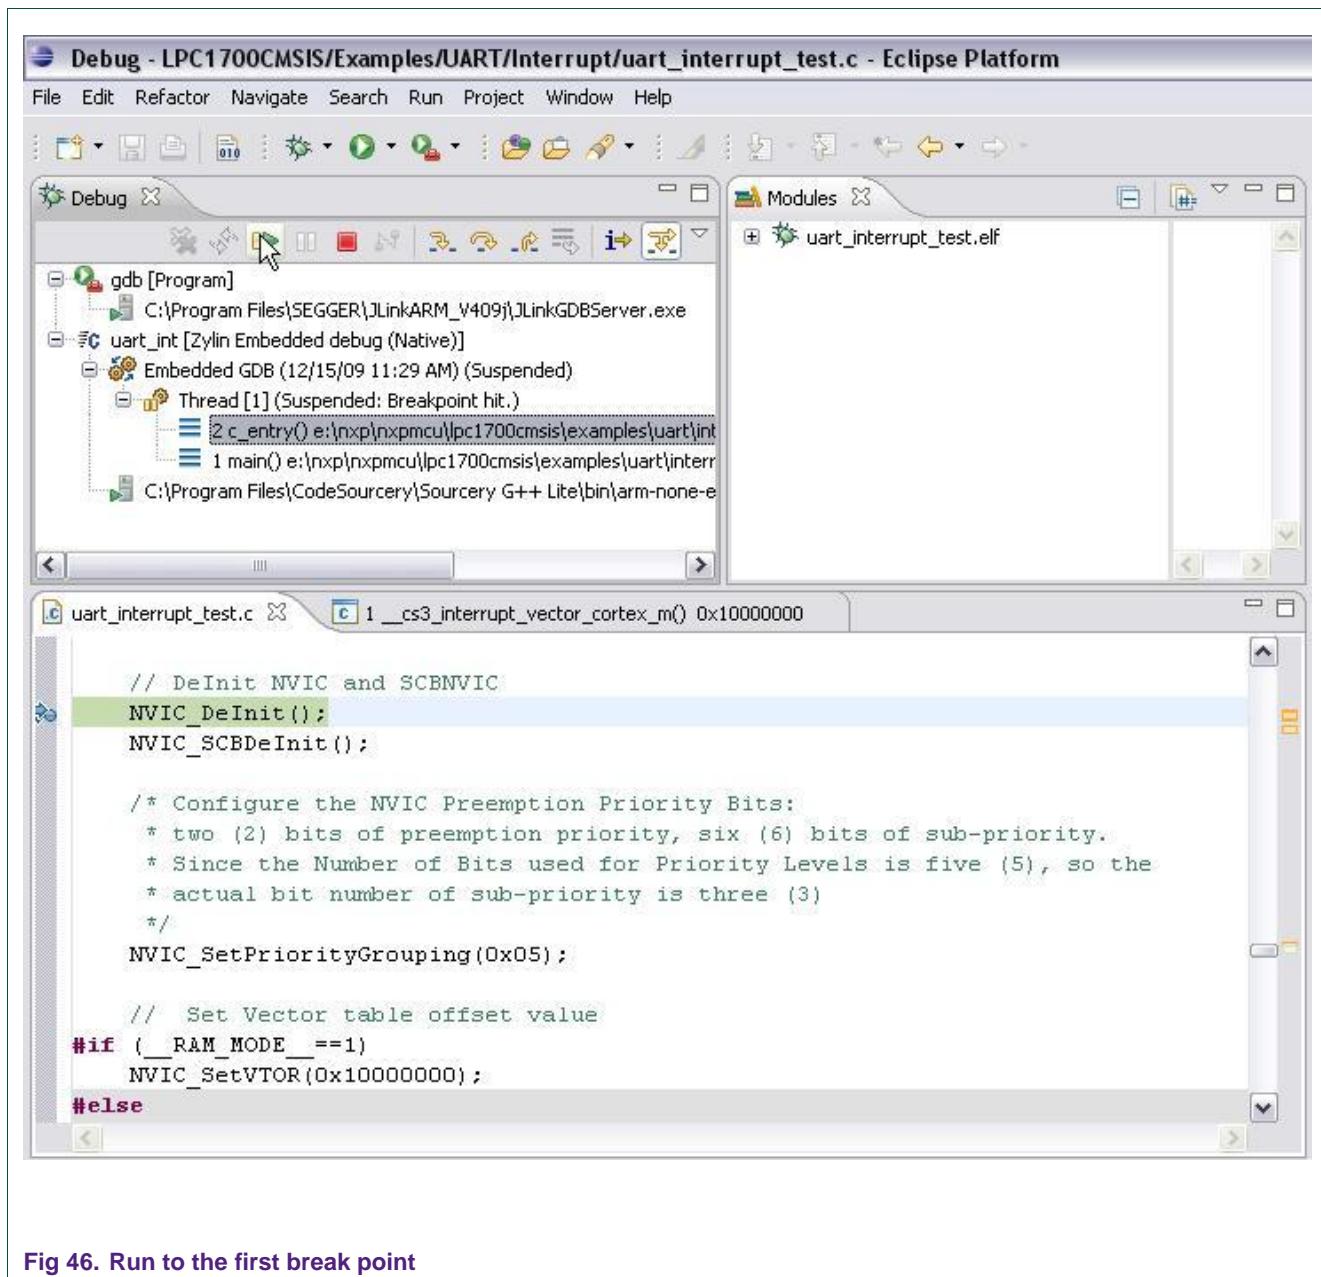

Fig 46. Run to the first break point

#### 4.9.2 ROM mode

- Build the example in ROM mode first.
- Use Flash Magic to burn an image file (.hex) into the chip
- Start a debug session in ROM mode.

Steps to configure debugging session in ROM mode are the same with RAM mode.

In fact, Flash downloading using J-link is possible but this requires some license from SEGGER.

## 4.10 Clean project

Make target for clean project:

- Clean: should be named as 'cleanall' in each example, this target should be executed before any 'make' session!!!

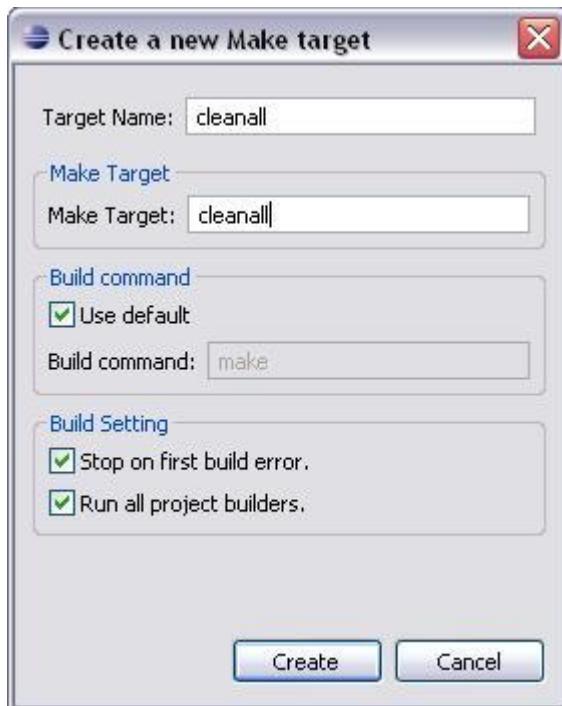

Fig 47. Make “cleanall” target

After clean, these example's files are removed:

- \*.o : object files (include driver's object)
- \*.elf: ELF files
- \*.hex: HEX files
- \*.map: MAP files
- \*.srec: SREC files

Beside, “\*.bin, \*.dbo, \*.dla, \*.dnm, \*.wrn, \*.c.orig, \*.h.orig, \*.depend” files also be removed if existed.

## 4.11 Compiling in command line

The package project is supported to build without Eclipse IDE.

In this case, the “zip” package is extracted on **C:\nxpdrv**, and a folder named “**LPC1700CMSIS**” will be generated on **C:\nxpdrv**.

Modify the value of symbol “PROJ\_ROOT” in the “makeconfig” file corresponding to the current location of project root (note that a **forward slash** is used in this case):

```
PROJ_ROOT = C:\nxpdrv\LPC1700CMSIS
```

Set environment: Refer to chapter 4.5.

Example that used to demo in this case is UART1\_FullModem

#### 4.11.1 Ram

```
C:\WINDOWS\system32\cmd.exe
C:\nxpdrv\LPC1700CMSIS\Example\UART\UART1_FullModem>make ram
```

Fig 48. Build example in RAM mode (Command prompt window)

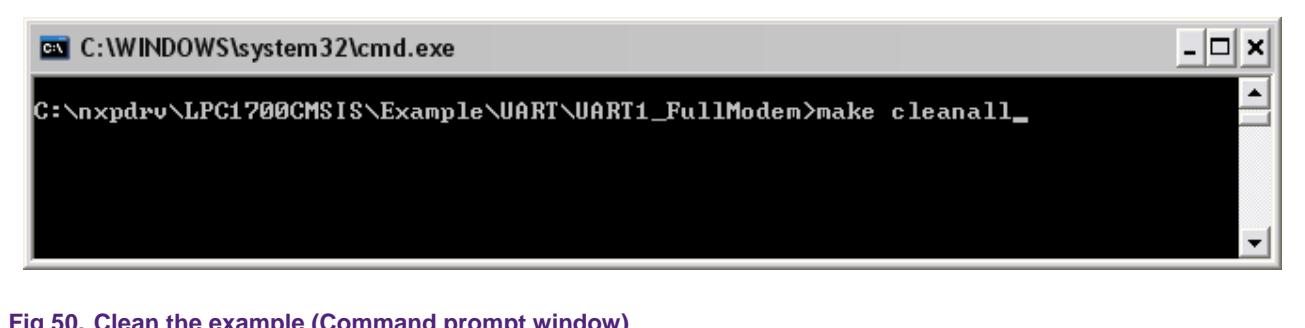

#### 4.11.2 Rom

```
C:\WINDOWS\system32\cmd.exe
C:\nxpdrv\LPC1700CMSIS\Example\UART\UART1_FullModem>make rom
```

Fig 49. Build example in ROM mode (Command prompt window)

#### 4.11.3 Clean

```
C:\WINDOWS\system32\cmd.exe
C:\nxpdrv\LPC1700CMSIS\Example\UART\UART1_FullModem>make cleanall
```

Fig 50. Clean the example (Command prompt window)

## 5. Using LPC1000CMSIS driver package with extension tools

The project we used to represent here is LPC1700CMSIS. Other LPC1000CMSIS project are correlative.

### 5.1 Keil RealView – MDK

In each example has attached Keil project in Keil folder. This folder contents project file and all configure files that need to run this example on Keil platform. It also already included all required files (startup, core, driver source files).

Here is the steps to run an exits Keil example or import an demo source file into Keil project sample.

#### 5.1.1 Keil example project

- Run \*.uvproj file in Keil folder. Such as follow ‘.\Example\ADC\Polling\Keil’ to open adc\_polling.uvproj file
- Chose correct target to run (RAM/ROM mode)

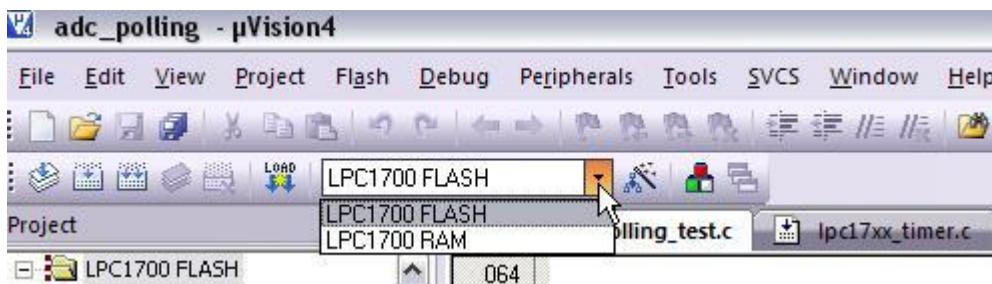

Fig 51. Choose target project

- Click 'Build' icon or 'Project > Build target' to compile this example

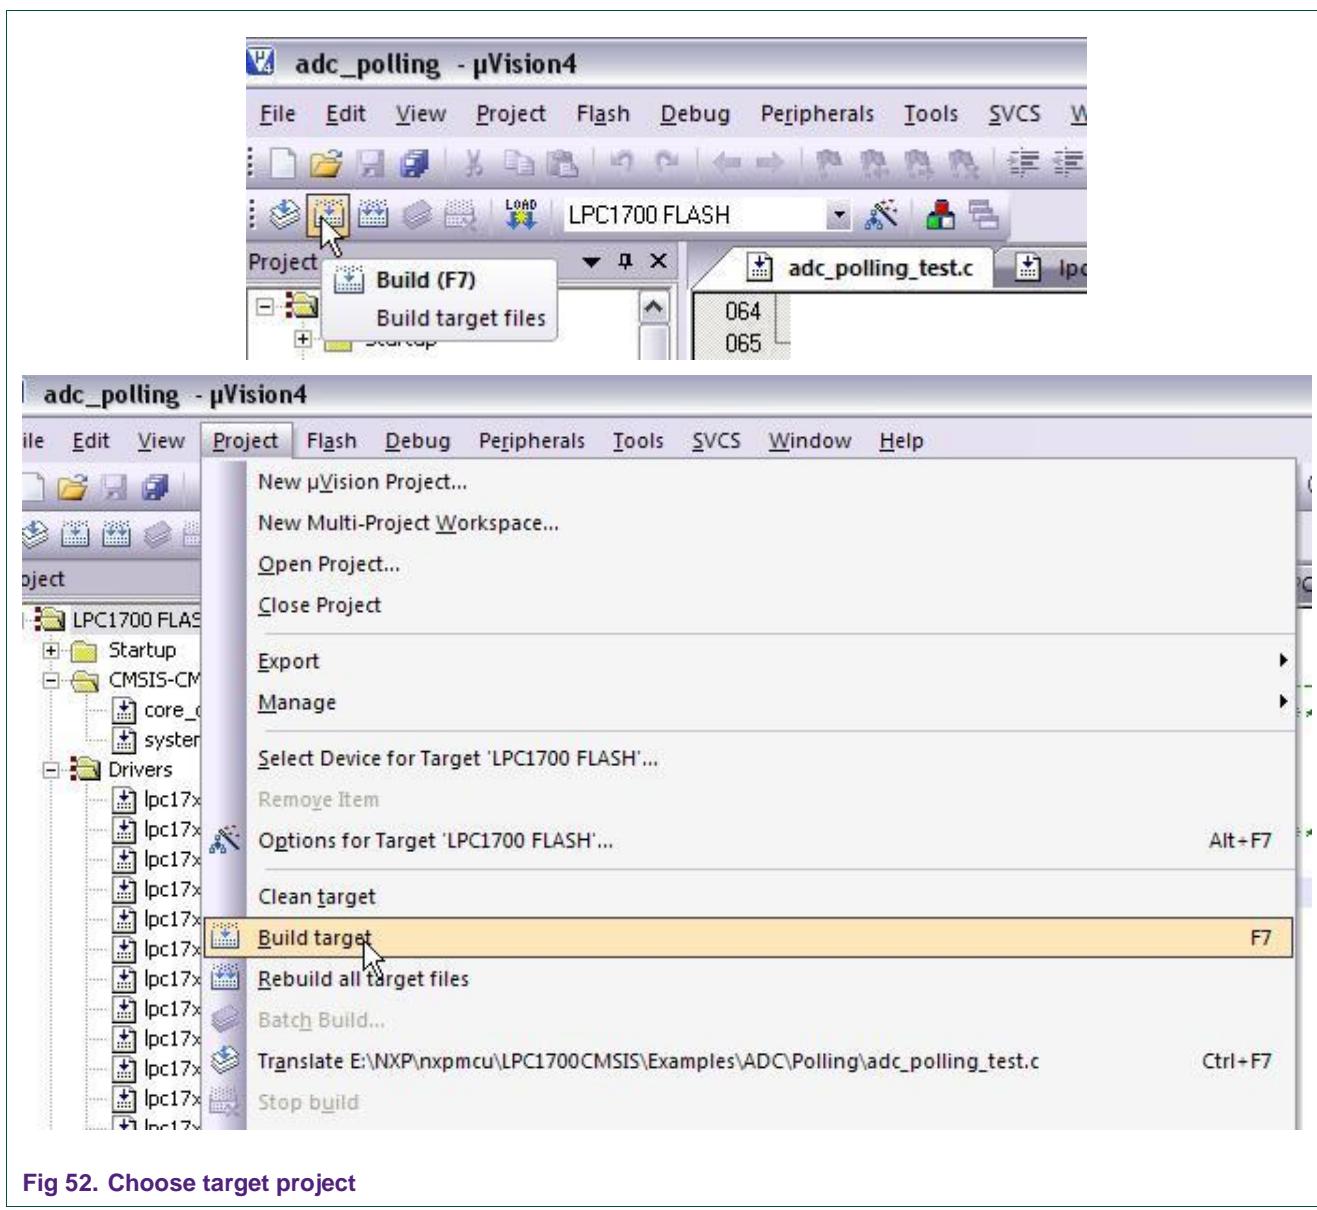

Fig 52. Choose target project

- Reference 'readme.txt' to get more information about hardware configuration and how to run this example.
- If choose ROM target, click 'Download' icon or 'Flash > Download' to burn image file into board
- reset board and run

**Note:** Project set ULINK Cortex Debugger as default. But you also can burn by Flash Magic or other flash download tools.

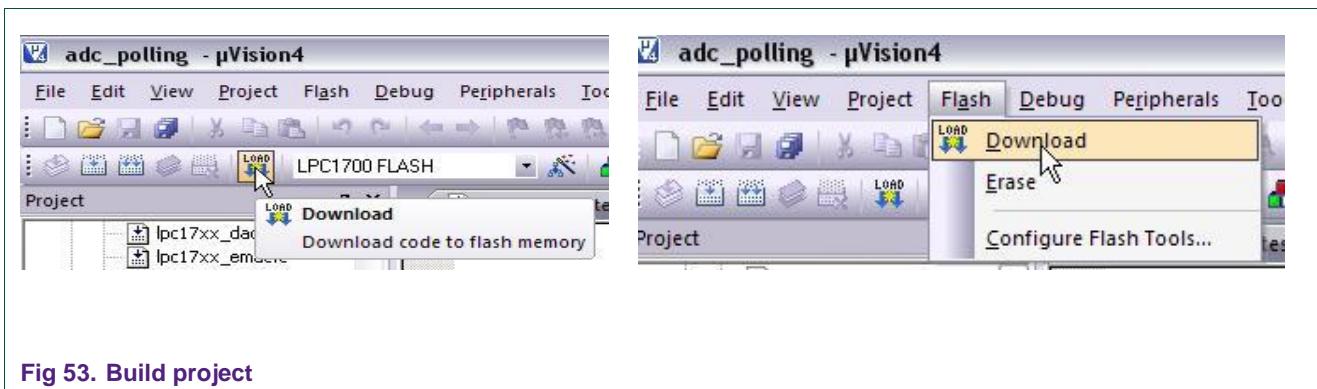

Fig 53. Build project

- If choose RAM target or want to debug in ROM mode, click "Debug > Start/Stop Debug Session" to start debug operation

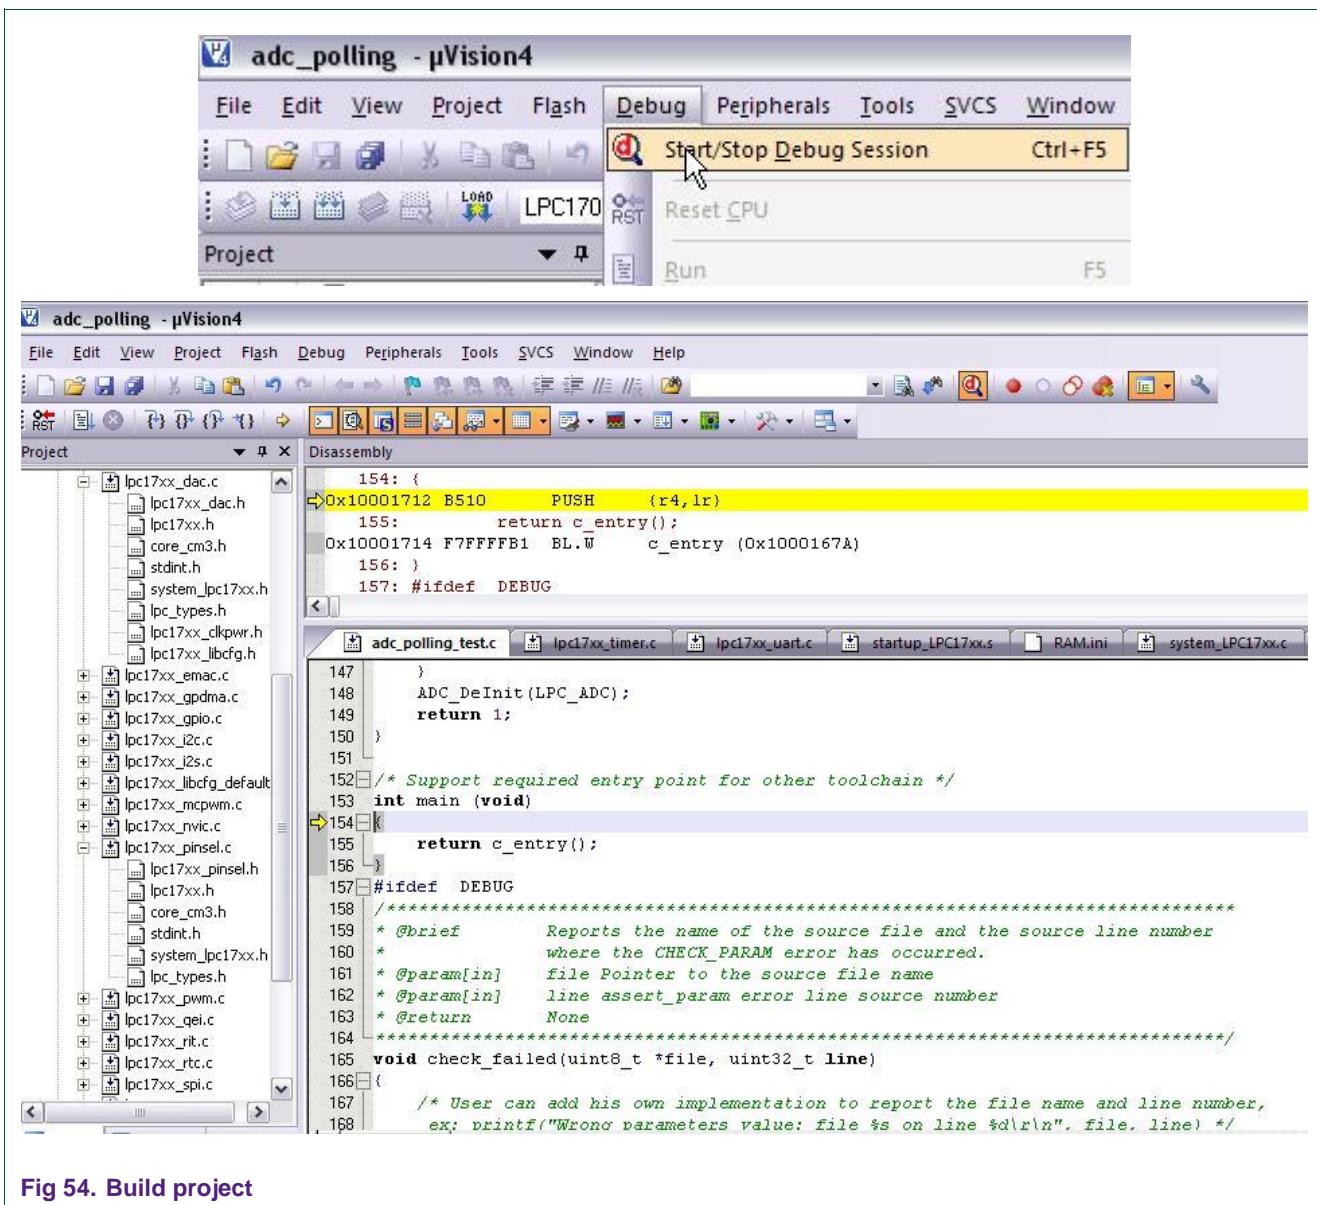

Fig 54. Build project

### 5.1.2 Keil project template

There's a Keil Project template inside .\Examples\Project\_Template\Keil\_RealView\_MDK directory.

This project is configured to add all required startup file (asm file used for RealView compiler), ARM Cortex-M3 core files and driver source files.

Following target properties have been configured:

- Target device (LPC1768)
- Memory layout with linker.
- Output and list directory.
- C/C++ definitions and Common C/C++ Include Paths (.\Core\CM3\CoreSupport; .\Core\CM3\DeviceSupport\NXP\LPC17xx; .\Drivers\include)
- Flash programming and debug tool.

The main program is template.c for demonstration. However, this demo program can be easily removed to add other main program source files for user's purposes.

Here're all steps to import demo (main program) source file into exist Keil RealView-MDK project sample:

- Open Keil RealView project template

Follow .\Examples\Project\_Template\Keil\_RealView\_MDK to open  
LPC1700CMSIS.uvproj (or .uv2 with older Keil project version) project file.

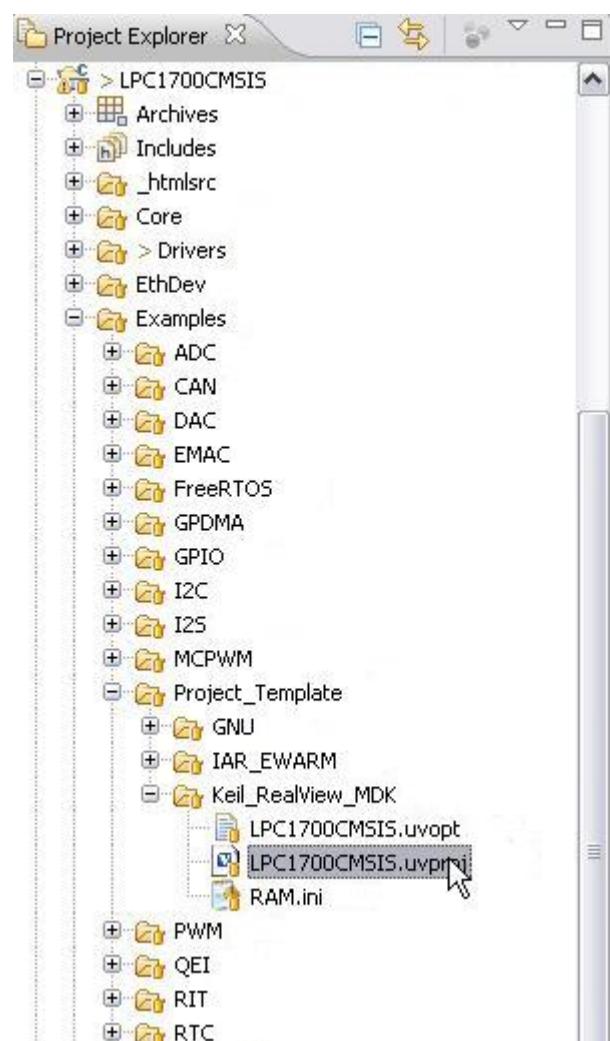

Fig 55. Open Keil RealView-MDK project sample

- Choose target mode

Setting RAM/ROM mode by choosing target:

- ROM mode: chose 'LPC1700 ROM' target
- RAM mode: chose 'LPC1700 RAM' target

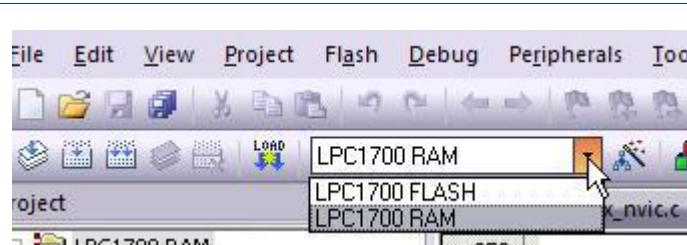

Fig 56. Choose target project

- Add main program source files

ADC Polling example is used in this case. Add all required source files (\*.c) in .\Examples\ADC\Polling directory.

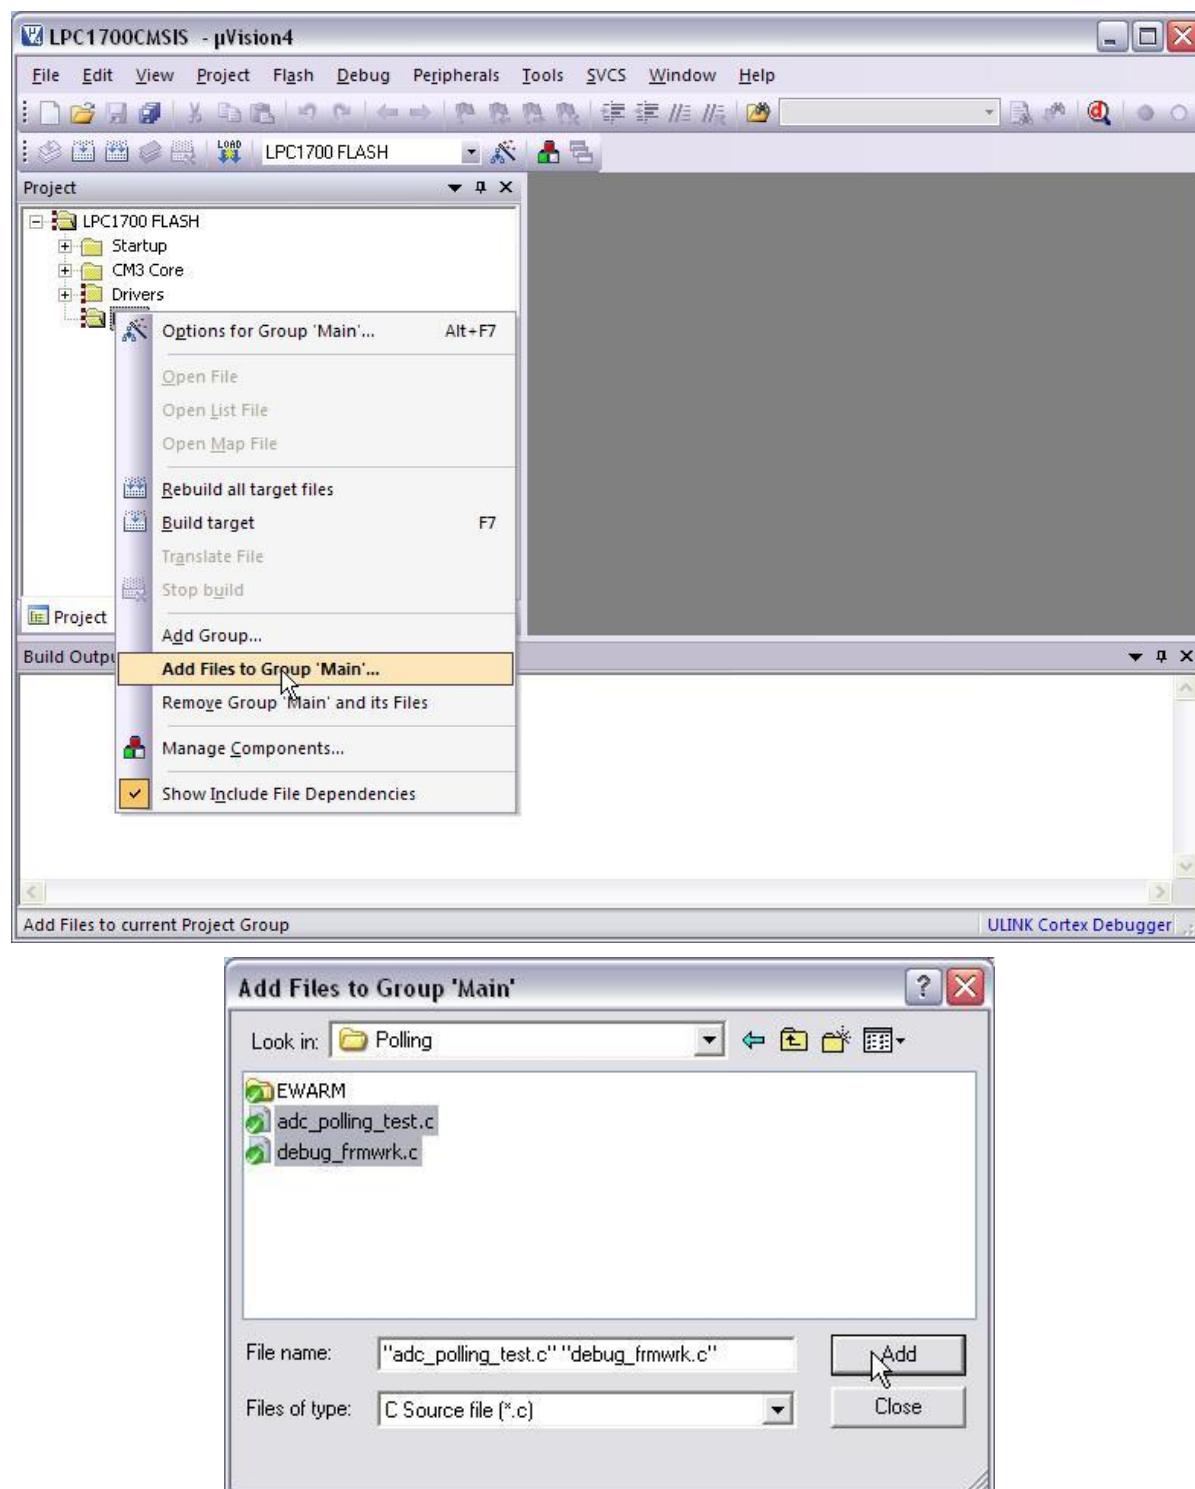

Fig 57. Add main program source file to project

- Add included Path

Add .\Examples\ADC\Polling into C/C++ Include Path of project.

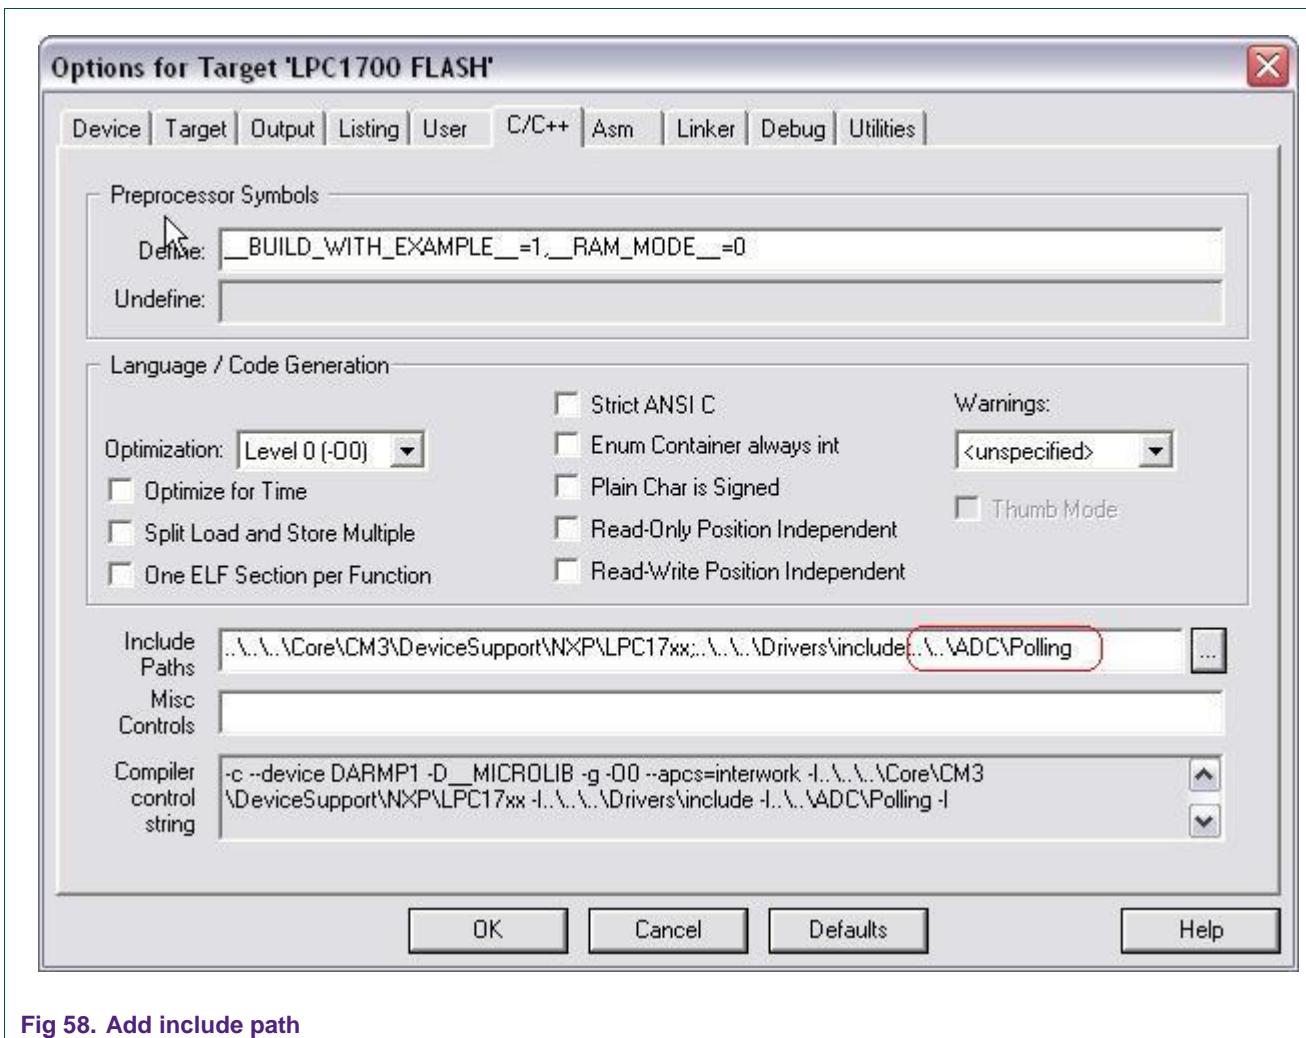

Fig 58. Add include path

**Note:**

There's a file named "lpc17xx\_libcfg.h" in each example directory. This file used to enable/disable individual peripheral driver in driver source code for compiler to build.

Specified symbol should be defined in order to enable corresponding peripheral driver used in main program.

For example:

If ADC, UART0 and TIMER are used in this demo program, corresponded symbol for these two peripheral drivers should be defined:

```
#define _ADC  
#define _UART  
#define _UART0  
#define _TIM
```

- Build project and run

The rest is very common. Execute build then burn image file into working board and let it run!

## 5.2 IAR Embedded Workbench IDE

In each example has attached IAR project in EWARM folder. It allows you run this example in IAR Embedded Workbench IDE. This project is configured to add all required startup file (asm file used for IAR compiler), ARM Cortex-M3 core files and driver source files.

Here're all steps to run exist IAR examples or import demo source file into exist IAR project sample.

### 5.2.1 IAR example project

Run .eww file in EWARM folder. Such as: follow .\Example\ADC\Polling\EWARM to open adc\_polling.eww file.

Click "Dowload and Debug" icon to start building and let it run.

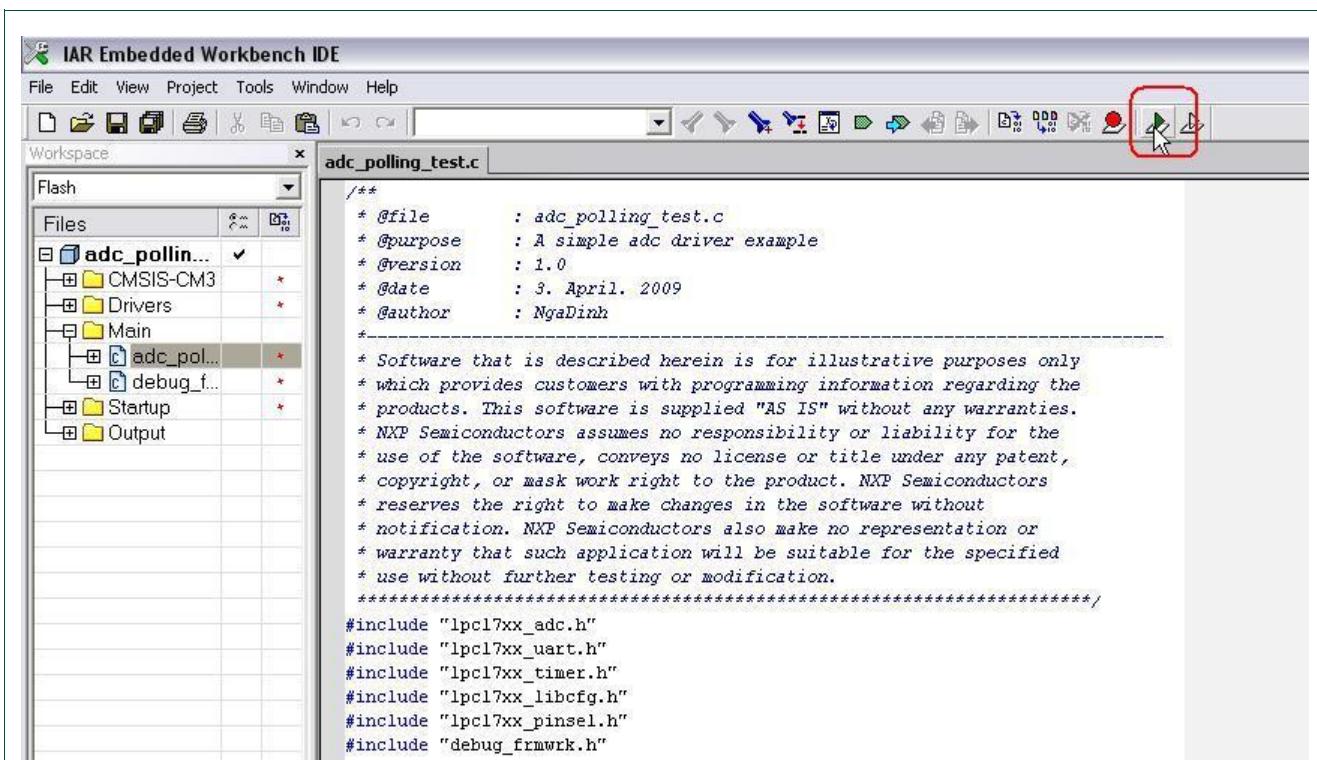

Fig 59. Run IAR example

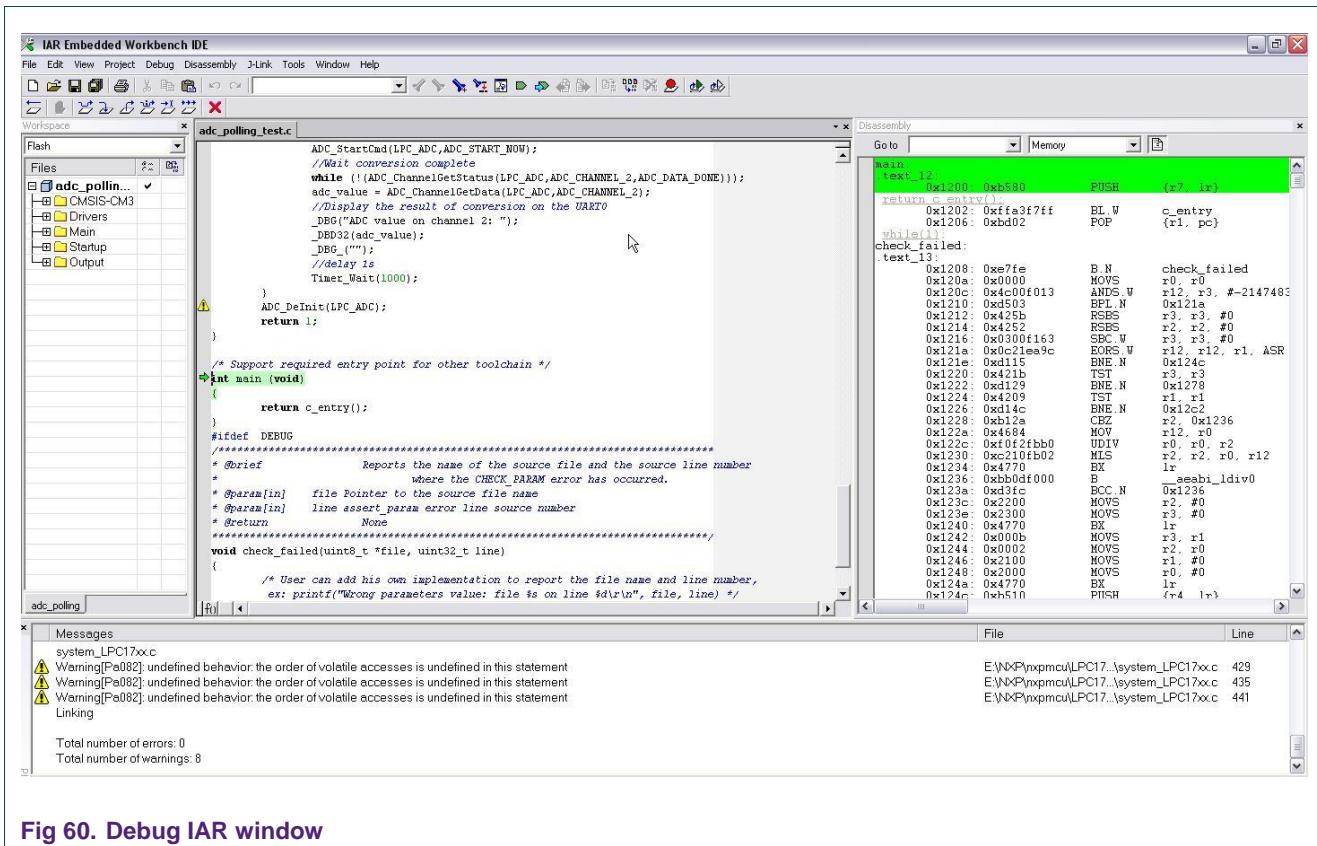

Fig 60. Debug IAR window

Switch to RAM workspace if want to run in RAM mode.

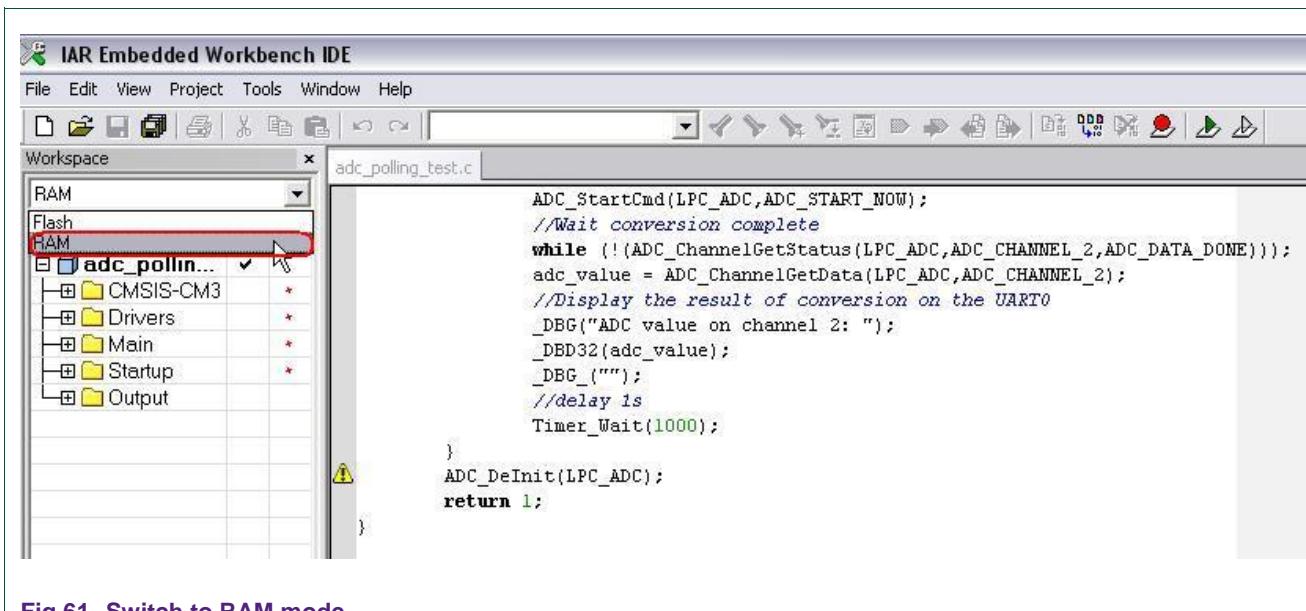

Fig 61. Switch to RAM mode

### 5.2.2 IAR project template

There's a IAR Project template inside .\Examples\Project\_Template\IAR\_EWARM directory. The main program is template.c for demonstration. However, this demo program can be easily removed to add other main program source files for user's purposes.

- Open IAR project

Follow .\Example\Project\_Template\IAR\_EWARM directory to open LPC1700CMSIS.eww file.

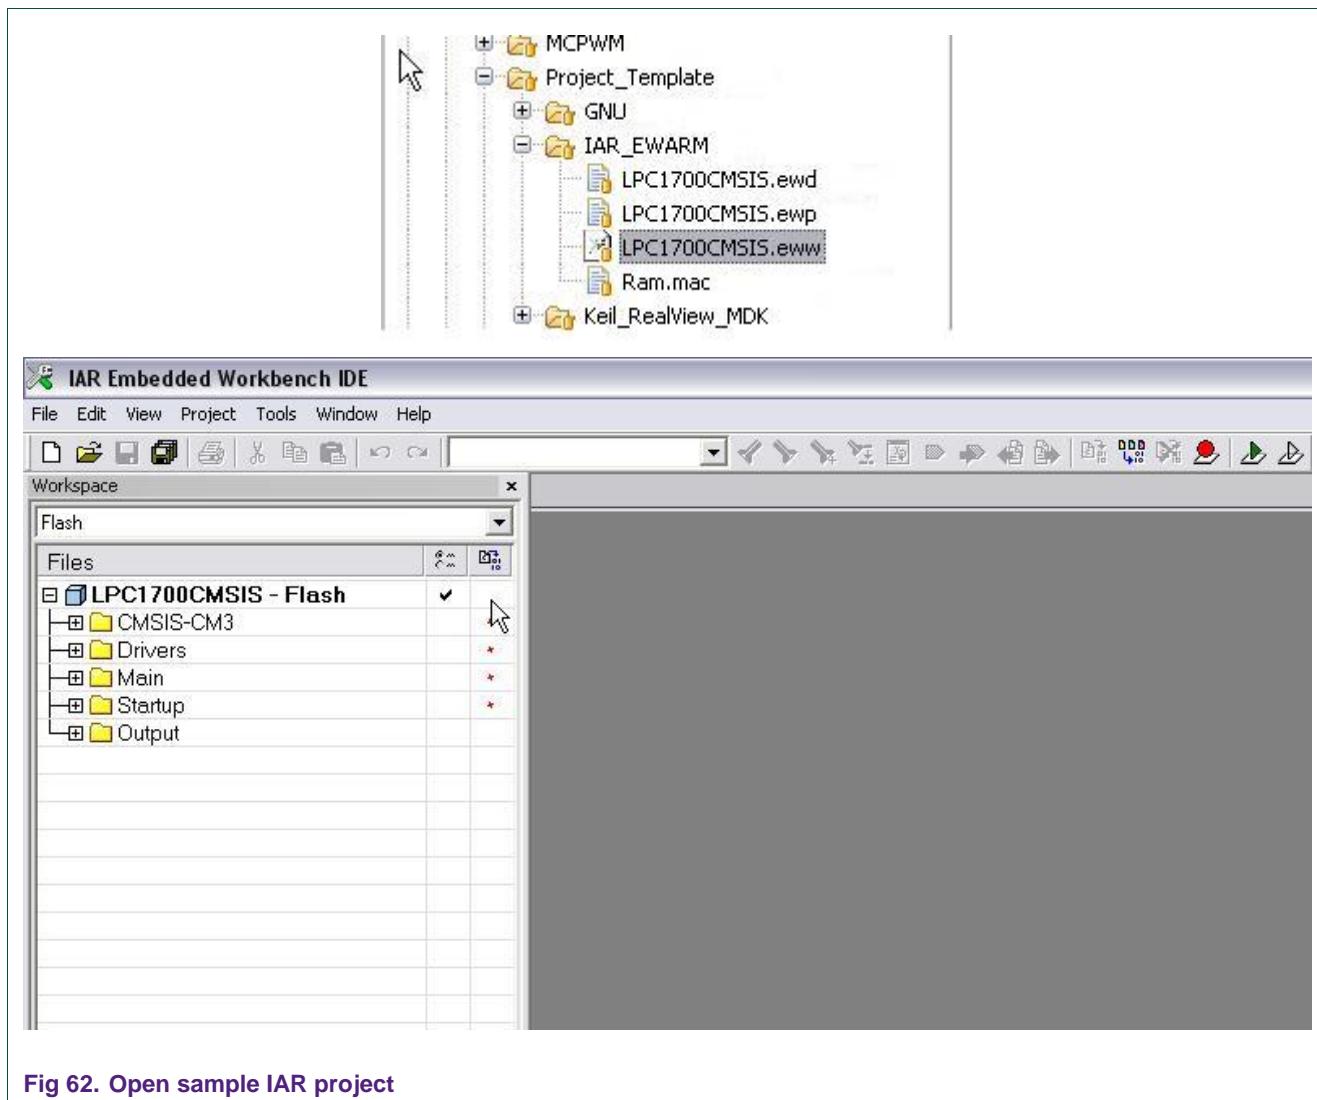

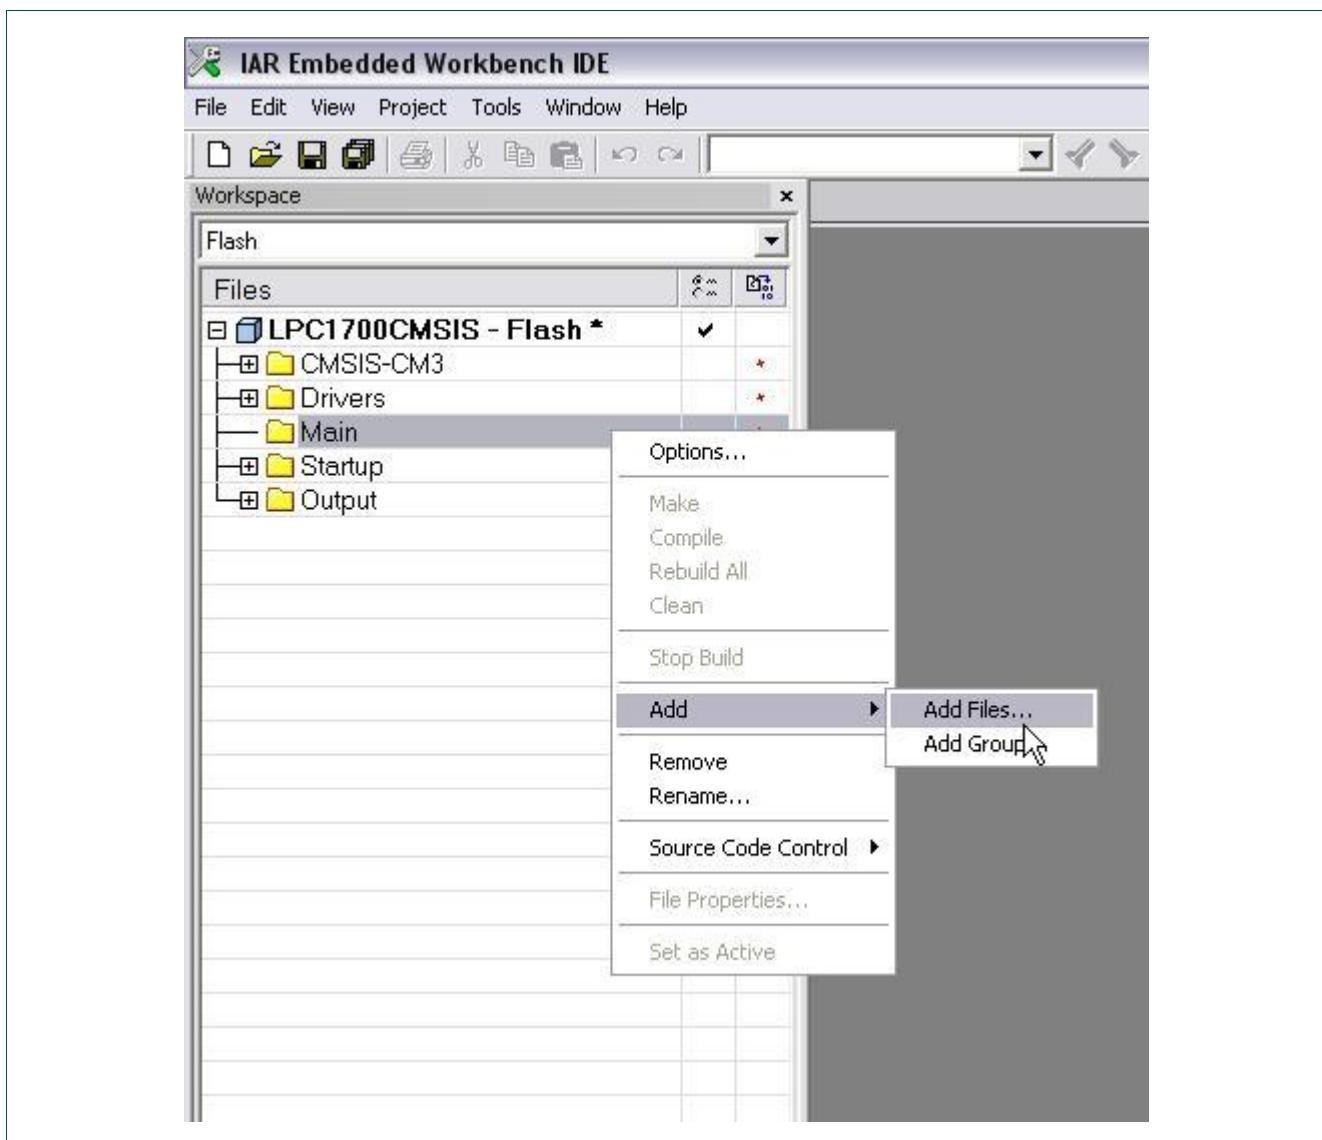

Fig 62. Open sample IAR project

- Add main source code

ADC Polling example is used in this case. Add all required source files (\*.c) in .\Examples\ADC\Polling directory:

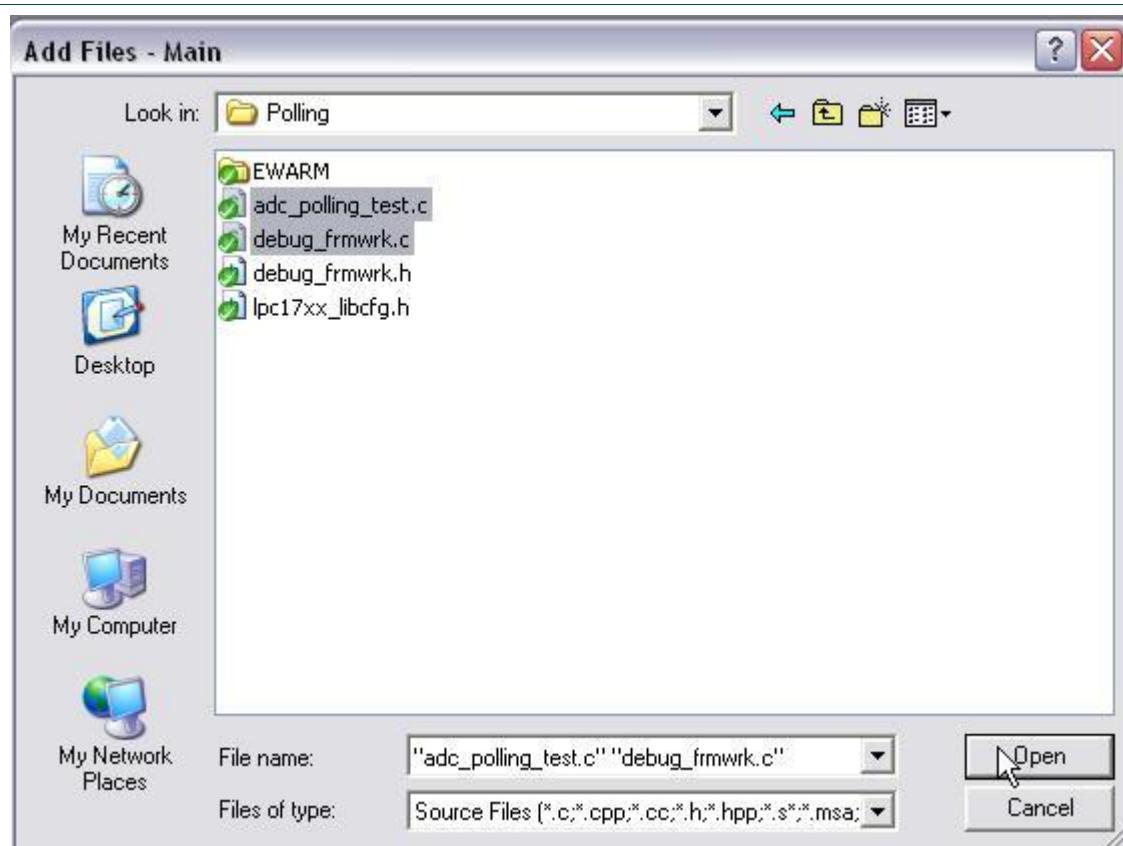

Fig 63. Add source code in IAR project

- Add include path

Open Option window by right click into LPC1700CMSIS-Flash workspace.

Add .\Examples\ADC\Polling into C/C++ Compiler/ Preprocessor tab as follows:

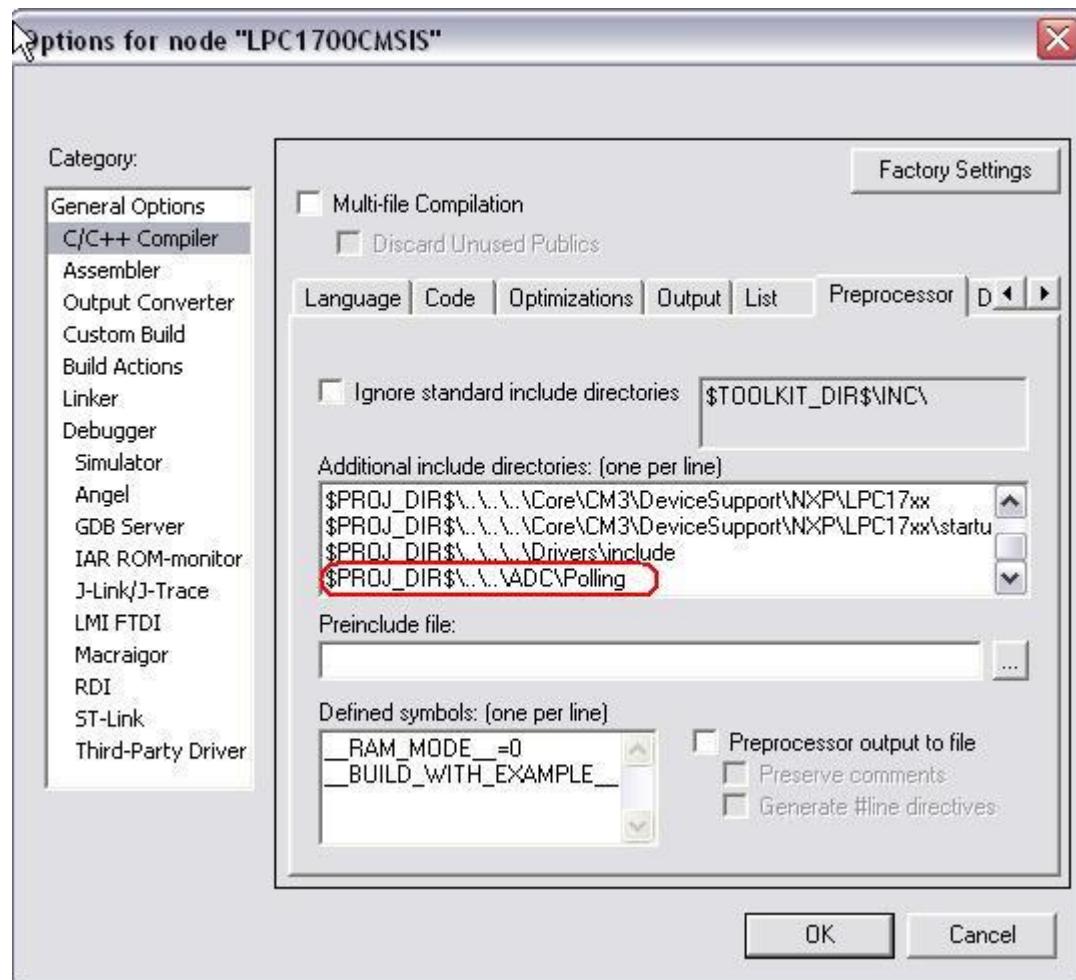

Fig 64. Add include path

Now, follow the same steps in “Use exist IAR example” to run it.
